Hi Hank,

I believe one of the computer stores here in town rents them.

Althought I'm not sure I can attend this year I'm sure some one from EOSS will be there... I would be willing to get a 2.5K projector or better for the confrence this size should be sufficient. It's what I do for a living so there will be no cost. Not sure what size screen we would like to go with but if we have a nice white wall we could use that!

Give me a shout to discuss! 303-359-5660

Subject: [GPSL] LCD projector rental

Roger and I are discussing this offlist, but just in case
it's of interest, there are a ton of places renting, some
nationwide (but big cities only, although sone deliver for
an added fee), that show up on Google.

The trouble is that typical of all rental equipment, it's
fairly expensive. Looks like an ordinary brightness
projector will typically cost $100/day.

That means it isn't feasible for my group of about 12 people.

I'll continue to pursue the idea of an NTSC video output
PC card driving a TV set.

All,

Aiptek has a clearance on the "pencams" that I've see a lot of people use for balloons, kites, R/C, etc. for $4.00 . There's a reasonable looking "regular" digital camera that can take a 512mb SD card for $19 and a DVR for $39.

Hi Roger,

Count on it. And you can put EOSS down in favor of the HoJo's. Only concern heard was whether the inhouse WiFi would be fast enough to let Rick N0KKZ run trajectory forecasts quickly.

BTW, would HoJo waive the conference room charge if enough GPSL members take rooms there? For now, I think you can expect 8 to 10 EOSS members to attend GPSL '07.

Hi Stan,

Thanks for the plug for www.eoss.org on:

www.arrl.org/news/features/2006/11/24/1/?nc=1

High altitude ballooning using ham radio has burgeoned over the last
10 years or so, but QST hasn't given it much press. The Great Plains
Super Launch has been the equivalent of Dayton for the growing numbers
of balloon groups, and last year, we had some 10 balloons aloft simultaneously
out of a site near Hutchinson KS. Next summer, we're looking forward to
an even larger launch out of Grand Island NE.

Check http://www.custom-ds.com/gpsl/ for details.

Hey, I□m having a problem with my GPS receiver and I wonder if anyone has seen this before. I□m experimenting with using a Garmin Etrex, so I took it for a run and watched for the speed and distance to change as I exercised. I don□t run the fastest, but I expect to see it display my current speed and distance traveled with reasonable accuracy. But no matter how fast I ran, it kept displaying a speed of zero miles per hour. And no matter how long I ran, it displayed a distance traveled of zero miles. I tried shutting it down and powering it back up a couple of times and even replaced the batteries once. Still the display won□t show what I thought were reasonable values for my speed and distance.

I□m inclined to think it□s not getting a good GPS fix. So I□m going to take the gym□s treadmill outside next week for one more test before sending the Etrex back to Garmin for repairs.

Paul

Paul,

You can relax and put your mind at ease. There is nothing wrong with the Etrex. This is a known problem with treadmills in general.

I'm no physicist but from a layman's point of view, when you step on a treadmill you are essentially entering a non-contiguous realm of space-time that isolates you, any objects you are carrying and the treadmill itself from the environment of the gym. Any action you take within that isolated space-time environment will have no detectable impact on the gym. Even common everyday phenomena such as Doppler shifting are automatically nullified by the gap between these "alternate realities". This can be easily demonstrated by singing a song. While you would expect the pitch of your voice to shift to a lower register from the perspective of a fellow gymnauts when he walks from in front of you to behind your rapidly moving body, in fact nothing of the sort happens.

So, moving the treadmill outside will have no appreciable impact on the readouts of the ETrex. It will still mistakenly think you are not moving anywhere at zero speed.

Don't feel bad, I had a similar problem a few years back. My car's speedometer/odometer is connected to my vehicle's front wheels. I took the car in for a pollution control inspection where they placed the car on a dynamometer. The car's rear wheels rapidly sped up and the car was soon being reported by the inspection station's test equipment as moving along at 50 MPH. But, my speedometer was still reading zero. I fired up my eTrex and, believe it or not, it reported the same as your's ... no speed or movement. I asked the technicians at the inspection station what the heck was going on and this is where I first learned of this decoupling phenomena.

As one famous scientist once said, "The Universe is not only queerer than we imagine; it is queerer than we CAN imagine."

Hi Paul.

We had a problem with an eTrex last year that we flew on a balloon, but of course that was just spitting NMEA sentences to a TT3. One thing you should check is the firmware version. Garmin updated the firmware for the eTrex to fix a number of bugs, but I can't recall which off the top of my head. All you need is a serial cable and the firmware and loader programs off Garmin's website.

Hope this helps.

Hi Paul,

Try duct-taping the Etrex to the moving belt on the treadmill.

Hi Paul,
Clearly the eTrex cannot sense motion when you are moving in the same direction as the treadmill. Try running backwards. Then divide the results by two because you will be going twice as fast.

Hi to the group,

The Kansas Wesleyan University physics club will be
launching a balloon flight for this Saturday at ~8 am
from Salina, KS EM18. This is a simple first time
flight and will carry a camcorder recording the
flight.
Gps on 144.34 @ 1 watt transmitting every 10 seconds.
1500 gram balloon. GGA & RMC lines transmitted.

2 school vans with students and tracking equipment
will be following.

Like Mark, we are expecting a NE track with fast jet
stream winds.

Listen in, reports will be appreciated.

Pete NØOY (SSOK group)

I have been receiving N0OY packets on 144.340 for a couple of hours here near Des Moines. There are GPS problems with lat/long/alt frozen but the time stamp is correct when subtracting 12hours (for CST).

Signal strength has been ~S2 with very little change. W0JRT (Lenexa, KS) and KA2FNK (Shawnee, KS) have forwarded scores of packets to FINDU but they stopped roughly a hour ago. Why this happened while I am still copying packets is a mystery.

I tried to find a cell phone number for Pete but without success.

I have been calling APRS stations on the telephone in western Illinois
asking for them to listen 144.340 and now have the following location:

As of 1830UT: 4034.0403 09105.3619 5882.5m (19,300ft) descending.

Stations in Quincy and Knoxville (near Galesburg) can no longer hear
packets on 144.340. The balloon and payload have evidently landed near
Blandinsville IL approximately 15mi NW of Macomb IL.

2780. GPSL 2007 contract pending...

Yahoo group: GPSL (2002 — 2008)

Hi gang!

I received the contract from the Howard Johnson. I need to see a virtual show of hands for our two lunch options. Our choices are to order off of an abridged restaurant menu or choose a buffet, both of which will be served to us in another private room. I've attached a couple of .PDFs with all of the options. Price wise there isn't much difference between the menu or the buffet with two entrees. Tax and tip are not included, she did pencil in an amount alongside the two entree buffet to give us an idea of price w/ tax & tip.

As for the request for a 'dutch ticket', it was denied. Apparently everyone will need to pay me the day of the event. She did say that they could set us up a cash box, so I could make change, if need be.

Let's narrow the voting field by first deciding:

* Menu or Buffet

If buffet wins then we can decide on entrees etc.

* I need a head count on those planning on attending GPSL 2007's conference & lunch.

We have at least 15 guest rooms blocked for the event at a price of $65.95 per room.
If we need more rooms, that can be arranged.

Traveler is still unsure whether or not we'll make it next year. Right now, it's 50/50.

If we do show, it'll probably be 1 or 2 for lunch, and I don't think we care what we eat, so long as it's good.

2791. New MicroTrak 300 version out

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-05 14:51:23 UTC
From: mconner1@gmail.com
Topic: 2791 Message: 2791

Now in kit form at $95. A 144.800 version and an 8-channel programmable unit is expected sometime next year.

73 de Mark N9XTN

http://www.byonics.com/microtrak300/

VHS and Byonics are pleased to offer the new Micro-Trak 300, version 1.3. Version 1.3 has improved features, including higher power efficiency, greater ease of interface, and is significantly less expensive than the Micro-Trak 1.1 at only $95.00! This 1/3 watt, 2 meter transmitter is available on 144.390 and uses the TinyTrak 3 PIC controller.

The new MT-300 is sold as an easy to assemble kit. No tuning or adjustments are required. Just solder on the parts, provide power, a GPS input, and an antenna output, and you are ready to track! The input connections may be made by soldering directly to PC board, but a DB9 connector is designed to slide over the board for those of you who don't mind the added weight. The Micro-Trak 300 measures 1 X 3 inches and weighs less than half an ounce! A manual will be available for download on the Byonics website (www.byonics.com)

Hi Marty,

Yep, you got the Call right.
I listened, but heard nothing, audibly or decoded APRS.
If it was putting out 1w I should've heard it. FinfU kept showing just over 22k.

Harry --

The N0OY KWU/SSOK flight was ascending very slowly, ~350ft/min, and tracking east in a hurry (118kts
in the interval I am looking at. It appears the payload was moving away from you too fast for
increasing altitude to create your required path.

I received a high percentage of transmitted packets here near Des Moines from 15:56z to 18:20z while
the payload tracked east across Missouri well south of me. I did not understand what was happening
until the last 5min when the GPS problem was resolved allowing a few packets to provide good
position reports when the payload was near Keokuk IA and the Mississippi River.

N0OY was transmitting on 144.340 so there was very limited APRS network coverage. A couple of
stations in the Kansas City area forwarded lots of packets containing bad GPS data but the payload
had tracked too far east for them to receive and forward packets after the GPS data was good.

When the GPS data straightened out the payload was right on my eastern horizon and heading further
east in a hurry. I received only a few good packets before loss of signal. But that was enough for
me to understand what was happening and I knew Pete needed more tracking data. I checked the real
time APRS maps and found a couple of active stations in western Illinois, then looked up their
license info then found their home telephone numbers.

Luckily Ron Rose, AA9GL, was at home in Quincy IL. He quickly QSYed his APRS radio to 144.34 and
received one good packet. Bill Pelton, WA9BNZ, was also at home near Knoxville IL but by the time I
called him the payload had (as I now understand) already landed.

Plotting of the few good packets I received with the one Ron received has provided a good idea of
where the payload landed. All of this information was forwarded to Pete (that is where the info in
the KWU article came from) and today Mark Garrett, KA9SZX, is putting a search plan together. The
payload includes a DF beacon with batteries that will last through this coming weekend. But

there
is a lot of deep snow still on roads let alone in harvested fields. Recovery, while possible, is
not going to be easy.

Thanks Ralph!

I hope they are able to recover it. I had thought along the same lines as Mark about airborne search when OSU was to fly last weekend. Those orange chutes will stick out like a sore thumb against the snow. An airborne search is how we got one of the ASTRO flights recovered. I contacted a pipeline pilot and he found it in a muddy pasture on his morning pipeline inspection.

Looks like OSU will attempt to fly this coming weekend, although there won't be much snow left around here by then for chute spotting. http://astro.okstate.edu/

Late news about the KWC/SSOK/N0OY payload. It has been recovered by Mark Garrett, KA9SZX, using the
DF beacon. Landing was 2.5mi SW of the center of the recommended search area in McDonough County
IL.

Hank -- I am located near Des Moines IA. The payload was built and launched in Salina KS. It is my
understanding that the DF beacon is a 28.322MHz crystal oscillator can (sometimes known as a
Fireball transmitter).

[image: ANITA in Williams Field]*McMurdo Base (Antarctica) *As every
year
from 1990, at the end of the austral spring, had started the
preparations
for the NASA's Long Duration Stratospheric Balloon campaign. This
year,
thanks to the improved facilities at Williams Field in the USA's base
of
McMurdo, hopefully will be sent aloft three balloons each carriying
diffrent
instruments to made circumpolar flights with a duration between 8 and
20
days.

After the arrival of the science teams, the payload's reading effort
started
early in November and are still going on, with most of the hard work
of
integration already done in the three instruments. The circular pattern
of
winds in the stratosphere -the so called "polar vortex"- has not formed
yet,
so taking account of the need to wait for the full stabilization of the
air
flow, the balloons would still wait some days to be launched.

The balloon base (located near the Williams Field airfield) have two
main
buildings High Bay 1 & 2, used as integration buildings and
laboratories by
the teams of scientists of each experiment. They are occupied only
during
work hours due to the fact that all the people working there have
their
sleep place in McMurdo, located a few miles away.
To see this year's main starrings, and their actual condition go to

Date: 2006-12-07 22:17:41 UTC
From: nssdz
Topic: 2819 Message: 2819

While shopping I saw at of all places "Walgreens" a TINY and I mean TINY digital Camera,,

It is 59mm by 42mm by 15mm and weighs only 27 grams! The package says it can take up to 243 pictures. havent see what that quality is like,, but in the photos area i added two pictures

1- of the camera itself next to a USB cable showing how tiny this thing really is.

2- then picture from the camera itself. not too bad quality..

and get this the camera was $9.95

I thought can't go wrong there..

I have yet to rip it apart to see how hard it would be to automate the taking of shots for a flight,, but holy cow 27 grams! YIkes!

Model rocket places have it (Google). One outfit was gaving
away a good handful for free by first class mail as an incentive.

Following Mike Manes' suggestion, I've also pulled out wire
from a busted hair dryer. Will have to measure, but it's typically
in the region of the diameter for *copper wire*
gauge #26 to #30.

Depends on how long your wire is and what you're using for
applied voltage.

Hi Troy,

I went to a couple garage sales and bought 2 or 3 old hair dryers for less then $2 a piece. They have 2-4 different sizes of nichrome in them. I can't tell you what Ga I used. I just experimented with a few homemade coils until I found what worked for my application.

If your wife's hair dryer dissapears...this was not my idea!

Troy, if you need some nichrome, I can send you some.

I've forgotten where I ordered mine, but it was in a spool of 50 feet. You only need three inches of the stuff, so I have way more than I'll ever need.

I used a 6 volt camera battery for the power source. Is it a 2CR5 battery? It looks like two cells side by side.

Paul

The problem I've run into with cameras like this is that they're not properly focused for infinity. So close ups of friends are focused well enough, but the horizon is a little blurry.

I'd be interested to see if you can adjust the lens.

Oh, the other problem is that they may not retain images once the battery is removed. If so, you want to make sure power is not lost until after you download the images.

A tiny camera like this may be neat for photographing experiments, where you don't need to see infinity (my favorite number).

Hi Brek,

I use two CR123 LiSO2 cells in series for 250# nylon line, and three of 'em for 500# line. You must keep circuit resistance to a minimum, so use a 5A rated contact relay and no more than about 3 ft of #16-2 cord between the battery and the burner. This will give you a good cut under tension in about 4 seconds. If you limit burner activation to 10 secs per shot, you can get about 10 shots out of a fresh set of batts.

EOSS parachutes have a pouch sewn into the inner surface of the 'chute canopy to carry the battery/relay pack. The relay coil is driven thru a buncha feet of #28-2 cord from the command receiver/decoder hung at the bottom of the shroud lines. Make sure to provide plenty of slack in the wire to accommodate nylon stretch under tension.

Terminating the NiCr wire to the Cu burned cord conductors can be tedious, since NiCr (basically stainless steel) doesn't tin easily. I used to use silver solder with a real nasty flux after abrading the NiCr wire to get a fair solder joint. But lately, I've adopted a crimp technique that seems to provide a good mechanical joint and can be soldered using the foregoing method. Get some hobby brass tubing just large enough to slip over the paired NiCr and Cu conductors and crimp it tight using vise grip pliers. Then solder.

From: Harry M
Topic: 2840 Message: 2840

ASTRO-6 was launched by Dr. Andy Arena (KE5CAB) and Joe Conner (W2OSU) just after 0900 CST from the OSU West Lab High Bay. Just before launch I positioned myself near the predicted landing site. The flight path was almost as expected. It followed the predicted profile but surface & low level winds were higher than predicted and the ascent rate was higher than predicted. Andy believes in using the EOSS term... "Just a little more gas!" :)

I rendevoused with Andy & Joe and soon after, we had burst at 96k ft. We spotted the chute and payloads at 3k ft and it passed overhead at 500 ft. We had a .23 mi walk into snowy woods, full of 50-75 ft trees, along a creek following deer trails. Sure was pretty! All 10 of the silver camera payloads were strung horizontally across some 8 ft trees. Had it been a pine tree it would've looked like a Christmas tree with decorations. The tracking payload and chute were on the ground close by. My 10m beacon had been ripped loose and was gone. All that was left was the attachment cord and most of one side of the wire dipole that the cord was tied to.

We stopped in the town of Yale, Oklahoma and had a great lunch. Joe pulled one of the cameras that had 1100 pics and we scanned through some of them. What we saw looked great! Then there was the camera from the team that forgot to clear the cameras memory before flight and left dorm video on the memory card. That will make an interesting semester presentation.

Here are the landing coord's for the record book...

W2OSU-11 N36ø07.590' W96ø34.240' O\`TH-D7:SPECIAL:ASTROn6 SPD=0 TRK=314 ALT=768 2006/12/09 17:22:29

BTW - Thanks for listening Steve (KC0YA). There's a beacon out there some where!

Hi Mike.

Yep, I think the consensus is PBC. Examination at the landing site showed many signs of it. The cutdown wire was severed and a couple of the student capsules had minor damage. I watched my video last night as it made it's final descent and the beacon was not there. It was just a can oscillator with a K-ID chip, so no big loss.

Paul,

Zack is already sending me some. I appreciate the offer.

Thanks!

73 de Troy, KC0MIC

PAUL VERHAGE <paul.verhage@...> wrote: Troy, if you need some nichrome, I can send you some.

I've forgotten where I ordered mine, but it was in a spool of 50 feet.
You only need three inches of the stuff, so I have way more than I'll
ever need.

I used a 6 volt camera battery for the power source. Is it a 2CR5
battery? It looks like two cells side by side.

Paul

>>> Brek Brixius <gofly2007@...> 12/7/2006 9:48 pm >>>
I'm reading Paul's book chapter 6 - NS6 Recovery Systems. It describes
a cutdown that uses 3 inches of 30 gauge nichrome. I found 40 feet of
29 gauge on ebay pretty cheap. Thats what I am going to try.

Anybody have recommendations on a battery to power the burner?

Brek - KC0YOE

Troy Campbell <kc0mic@...> wrote:
All,

Where do you get nichrome wire? And what gage is usually used for
cutdown devices?

Thanks in advance.

2845. RE: [GPSL] Burst height, ascent rate discontinuities

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-10 18:57:04 UTC
From: Rick von Glahn
Topic: 2820 Message: 2845

Just as an observation from a number of flights ...

I don't think there is ever going to be any way to accurately predict ascent rate and burst altitude.

Take a look at a few of these charts:

http://www.eoss.org/ansrecap/ar_100/recap84.htm

http://www.eoss.org/ansrecap/ar_100/recap85.htm

http://www.eoss.org/ansrecap/ar_100/recap86.htm

http://www.eoss.org/ansrecap/ar_100/recap97.htm

http://www.eoss.org/ansrecap/ar_130/recap102f.htm

http://www.eoss.org/ansrecap/ar_130/recap103_104d.htm two balloons compared one launched right after (45 min) the first

http://www.eoss.org/ansrecap/ar_130/recap105_106f.htm leaking balloon

http://www.eoss.org/ansrecap/ar_130/recap107_108.htm click through 2 compared, again two flight separated in time by 45 minutes.

The ascent rate of most of our balloons over Colorado fluctuates significantly and dramatically during the course of a flight. If you want to examine the raw data, it's posted on those web pages and you can run your own analysis.

Several years ago we were wondering about this and a scientist from NOAA, Cecilia Girz, made the obvious comment that atmospheric air flow isn't a flat phenomena. Winds don't move exactly parallel to the surface of the earth at a given velocity from a given azimuth. The move up and down and all around.

Checking the links for 103/104 and 107/108 you can really see and begin to believe this. Two balloon go through the same slice of sky 45 minutes apart and their ascent velocities are all over the place. When you look at only one balloon you start to think pinhole leak or some other explanation, but in the case of 103/104 you get pretty much exactly the same profile. However, one balloon is filled a little more and has a higher overall ascent rate. This difference almost makes the case when you look at the data.

Burst, not so much of an educated opinion here, just that each balloon undergoes a significantly different ride from inside the box to 100,000 feet. Some are touched by un-gloved human hands, some pickup minor debris on the ground. Some are overfilled and race into the sky, others take a more leisurely flight to the edge of space. Some pass through clouds, some don't. All this has to have some kind of impact on the integrity of the envelope. And

at 90,000 plus feet these minor alterations may start to have a significant roll in just when the balloon decides it's had enough torture and decides to succumb to the differential pressures.

NEVER! Our flights are NEVER touched by un latex covered hands, And then only to un-roll the balloon out. And then we try our hardest to only touch the thick part of the balloon. And NEVER NEVER EVER slide the balloon period!

> some pickup minor debris on the ground.

Again,, we never inflate the balloon unless it is inside a building protected from the elements. No Wind, nothing..

A heavy blanket is laid on the ground,, than a tarp,, similar to the blue ones you always see. then on that a virgin piece of polyethylene sheeting/ this is the ONLY thing that touched the balloon.

> Some are overfilled and race into the sky, others take a
> more leisurely flight to the edge of space.

Our flights we always only went with 1 pound of extra lift.. no more,, no less.

> Some pass through clouds, some don't.

Can't control that unless you only launch into a totally cloud free sky.

> All this has to have some kind of impact on the integrity of the
> envelope.

All the above I would also think it would, the clouds,, maybe,,, but even any surface damage of any kind on the balloon,, is just like cutting glass, the glass may be 100 mil thick,, but it breaks where there is a .5 mil scratch in it.

That's why I always cringe whenever I see videos from other groups where you see three or four people pressing their hands against the balloon while it's filling to keep it stable. If that ever happened at one of our flights you would be asked to go home right then and there and never allowed at one of our flights again!

> And at 90,000 plus feet these minor alterations may start to have a
> significant roll in just when the balloon decides it's had enough
> torture and decides to succumb to the differential pressures.

As far as predicting burst altitude,, we have always been pretty close
as to our predictions, +- 2 or 3 K feet max.

Rick, Ralph,

I agree with all that. The reason I've persued it any further than my last re-write last summer is that I noticed a "tendency" for our flights filled the same way and launched in similiar conditions to lose about 200 fpm at a particular altitude. [Not consistant, but persistent]. I brought this up with Bill Byrd at ISU during a visit I'd had with them, and they stated that it was consistent and he that it was a change in drag. That puzzled me because, why should drag be higher when the air density is lower? {Beause the balloon is bigger?} Then I found it referenced in the PDF I'd attached earlier and it tweaked my curiosity again.

I don't think we'll get anything smooth, but if there is a drop in ascent rate at 1 or two altitudes, it wouldn't be hard to model it and test for it. And 200fpm is significant enough to pay attention to it. Can't hurt to simulate it some. I just know that ascent is not constant but that is how we calculate an initial path currently. I just think we might be able to curve fit a little better. It probably won't make much of a difference but a mile or two or five closer won't hurt.

Troy

We pretty much just take 2k ft from the published altitude from Kaymont's chart and that get's us pretty close to the burst height. If you have a methodolgy for determining burst height more definitively, I sure would like to include in the in the on-line flight prediction system. And I'd bet the Rick would like to see it too.

I don't think we'll start ejecting people permanently for messing up though.
A) It would be our fault for not training them.
B) We'd be out of people pretty quickly.

All we do is crunch the numbers.

Take total lift, balloon and positive lift included. and convert that
into cuft of gas needed to provide that amount of lift.

divide that number by the volume of the balloon at burst. this will
give you a percentage number.

find what level of the earth atmosphere matched this percentage,, and
that's your burst altitude. plus or minus say 2 K

has worked every time for all of our flights.

2853. Re: [GPSL] Nichrome wire

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-10 22:31:59 UTC
From: Brek Brixius
Topic: 2820 Message: 2853

Thanks Mike. I'll check out those batteries.

The crimp suggestion is great too - something I hadn't thought of and that will likely save me some frustration when I'm ready to assemble the cutdown. I live in a small community where shops are limited and many are closed on weekends. In most cases I can't just run out and grab a part when those unforseen events pop up.

Thanks again.
Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Brek,

I use two CR123 LiSO2 cells in series for 250# nylon line, and three of
'em for 500# line. You must keep circuit resistance to a minimum, so
use a 5A rated contact relay and no more than about 3 ft of #16-2 cord
between the battery and the burner. This will give you a good cut under
tension in about 4 seconds. If you limit burner activation to 10 secs
per shot, you can get about 10 shots out of a fresh set of batts.

EOSS parachutes have a pouch sewn into the inner surface of the 'chute
canopy to carry the battery/relay pack. The relay coil is driven thru
a buncha feet of #28-2 cord from the command receiver/decoder hung at
the bottom of the shroud lines. Make sure to provide plenty of slack in
the wire to accommodate nylon stretch under tension.

Terminating the NiCr wire to the Cu burned cord conductors can be tedious,
since NiCr (basically stainless steel) doesn't tin easily. I used to
use silver solder with a real nasty flux after abrading the NiCr wire
to get a fair solder joint. But lately, I've adopted a crimp technique
that seems to provide a good mechanical joint and can be soldered using
the foregoing method. Get some hobby brass tubing just large enough to
slip over the paired NiCr and Cu conductors and crimp it tight using
vise grip pliers. Then solder.

2857. ORB & Google Earth

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-15 03:39:28 UTC
From: Harry M
Topic: 2857 Message: 2857

I have uploaded Google Earth Placemark files to the ORB "FILES" area.
Each of these will display the flight path for each respective flight.

If you have Google Earth installed on your computer, click on the Placemark and it will fly you to a location and display that flight. If you would like to install Google Earth and have high speed internet, see the last paragraph below.

For those of you that do not have high speed internet or Google Earth, I have uploaded a picture of all the flights. The .tif is better quality than the .jpg.

GOOGLE EARTH

Google Earth streams the world over wired and wireless networks enabling users to virtually go anywhere on the planet and see places in photographic detail. This is not like any map you have ever seen. This is a 3D model of the real world, based on real satellite images combined with maps, guides to restaurants, hotels, entertainment, businesses and more. You can zoom from space to street level instantly and then pan or jump from place to place, city to city, even country to country.

Get Google Earth. Put the world in perspective.

Hi Joe,

Bill 'ELK is is acknowledged Grandpa of ARHAB. He's celebrating the 20th anniversary of his first flight this summer from hid old home QTH in OH. Bill does deserve credit for inspiring ARHAB in the US.

Anyway, Ma Nature giveth and taketh away ... so keep close tabs on those models and forecasts! Easterlies at any altitude that we can hope for are oddities in the winter.

2867. WB8ELK-12 status report and updated landing site prediction

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-23 23:27:51 UTC
From: wb8elk@aol.com
Topic: 2867 Message: 2867

The balloon keeps going up at about 500 ft/min even after balloon sunset.
I'm at a total loss of explanation why it's doing that considering the past 4 or
5 flights with similar nozzle lift and payload weights stopped dead in their
tracks (ascent-rate) at sunset.

Based on the current ascent rate, I estimate the balloon will loop briefly
to the west and then south as it get higher and would land about 40 miles east
of Chattanooga along the TN/GA line near Blue Ridge, GA at around 7 pm
EST....although there is limited data on the winds above 100,000 feet available so
this is only a rough guess.

It appears that the styrofoam box I used (scavenged from an old ozonesonde)
seems to be keeping things fairly warm inside...it's 2 inches of foam and
sealed pretty well.

- Bill WB8ELK

2868. WB8ELK balloon position is now showing the exact touchdown point near Murphy NC

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-24 05:00:10 UTC
From: wb8elk@aol.com
Topic: 2868 Message: 2868

Turns out the payload landed less than a mile (Peachtree, NC just east of Murphy) from Eddie WD4JEM's father (K4AIH) who was able to hear the packets with his HT from inside his house (with a hairpin antenna no less). Also Bob Grove W8JHD lives about 1.5 miles away on the other side of Mission Mountain and could hear it strongly as well.

As we were discussing where it might be I received an email saying it was now reporting the actual position on FindU and it appears to be right on the peak of the mountain...probably up in a tree. Bob W8JHD is going to drive up the mountain tomorrow to try to get a visual on it.

Flight statistics:

Peak Altitude: 97,562 feet
Time Aloft: 4 hrs 2 minutes (launch: 2032z - landing 0034z)
Downrange: 155.5 miles at 80 degrees from launchsite

Landing site coordinates:

35d 05.04m
83d 56.54m

Launchsite coordinates:

34d 43.50m
86d 38.74m

73s de Bill WB8ELK

PS:

1500 gram balloon (Scientific Sales)
Flight train weight: 2lb 2oz
Nozzle lift: 2lb 12oz
Free lift: 10 oz
parachute: 36" dia

2869. WB8ELK balloon has been recovered from the tree

It turns out that HiBall-10 landed less then a mile from Eddie Foust's WD4JEM father's place (Jim K4AIH)....K4AIH alerted local hams who went out on a search today.

Also Eddie had alerted Bob Grove W8JHD in Brasstown, NC who drove out early this morning and got close but had to turn back due to heavy fog.

Later in the morning Edwin Flowers KG4LVO and Marty Clark KG4WPV of Andrews, NC went on the search using nothing but HT's and a small beam as they did not have APRS equipment or the balloon's final location as reported on Findu. This is a challenging effort due to only 1 second transmissions every 30 seconds on a very busy APRS frequency.

http://map.findu.com/wb8elk-12 (http://map.findu.com/wb8elk-12)

They walked up a private road owned by Jack Wimpy that took them to the top of Mission Mountain where the signal got strong enough to be heard without an antenna on the HT....They looked up to see it right on top of the peak of the mountain about 50 feet or more up in a tree. Marty KG4WPV decided they weren't going to leave empty-handed so he climbed clear to the top and pulled it down.

My thanks to all who participated in the chase,

73s de Bill WB8ELK

Congrats, Bill!

This is why EOSS always carries an independent CW/DF beacon on every
flight. It's saved the day more times than I can remember. At 1.1 lb,
and serving as a cutdown command receiver half the time, it's worth
its weight in gold.

73 de Mike W5VSI

PS: Any luck finding those Honeywell pressure transducers?

Hi Mike,

I usually do fly a backup beacon....but this flight was very weight constrained to attempt the sunset float so I had to rely on a single transmitter. A backup beacon is highly recommended to those considering a first launch. It was the primary way that the recent balloon flown from Kansas by Pete Sias and the University was found days later by Mark KA9SZX in Illinois (in a foot of snow) since the APRS battery had long died and the GPS lost lock before it landed. His beacon was a keyed 10 meter clock oscillator with a 2m harmonic (antenna resonant on 2m)...not much power on 2m (about 2 mW) but very effective.

Hi All,

A question was asked and so far all that I have asked really didn't have a solid answer, so Bill ELK suggested to see what everyone thought here.

When setting up the beacon for the transmit of the APRS signal,, with all the changes recently made,, what is the Best string to write to the unit?

ya know withe WIDE and all that?

Joe WB9SBD

Hi Joe,

The PATH all depends on what the APRS system load/coverage is like in a given area. Here are a couple links that should help.

http://www.ew.usna.edu/~bruninga/aprs/fix14439.html

Hi Bill,

We flew one of those "standard" CMOS clock oscillators on one of our
balloons. Unfortunately, it was on a "standard" used by SVGA monitors,
so we heard it EVERYWHERE once we in populated areas. And the 5th harmonic
power is pretty puny - tough hear after the payload is on the deck.

2876. ANSR-33 DIY ZP floater Friday 29Dec06

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-28 14:46:04 UTC
From: Ralph Wallio, W0RPK
Topic: 2876 Message: 2876

ANSR-33 NG0X DIY Zero-Pressure balloon 48hr flight details at

http://www.ARHAB.org

http://www.kd7lmo.net/psk31.html

http://www.kd7lmo.net/qsl.html

There may be late breaking info about downlink bands, transmit intervals, launch time, etc.

Keep up-to-date with predicted track via:

http://adds.aviationweather.gov/winds/

Select FL420 (instead of default SFC)

Select 1800UTC Fri 29 Dec 2006

Select WIND SPEED and/or WIND STREAMLINES

Check later 6hr forecasts, e.g., 0000UTC Sat 30 Dec 2006, as well as forecasts for actual float
altitude, e.g., FL360.

Current forecasts predict track over TX, OK, KS/MO/IA, IL/WI, MI, PA/NY.

Please attempt to receive and report telemetry received via PSK31 on 14,070.45 (20m) and AFSK/FM
APRS telemetry on 50.620MHz (line-of-sight).

Signal is very good into Vienna, VA (FM18) ... at 4:36am local. (This MIT student has not yet recovered from term and returned to a sensible sleep schedule).

Seems its current location is southwest of San Antonio, Texas, so, back over the USA.

Good going guys! This is quite an accomplishment.

I will leave the computer up overnight, though I suspect the daytime crew will resume operations in a few hours. I will continue watching to see how it progresses. This is very exciting.

73,
Ben

2880. ANSR-33 DIY ZP is floating

Yahoo group: GPSL (2002 — 2008)
Date: 2006-12-30 12:29:54 UTC
From: Ralph Wallio, W0RPK
Topic: 2880 Message: 2880

An update on ZP floater ANSR-33 --

Floating track after launch was to the south well into Mexico at ~25kft. 20m closed at ~00UT with
no further fixes until 0936UT when Ben Gelb, KF4KJQ, captured a complete PSK-31/20m transmission in
Vienna VA.

ANSR-33 had turned east and then north in cyclonic winds around a low in NM/TX and, at the time of
this fix, was north of the Rio Grande River south of San Antonio floating at 18kft moving NNE at
95mph.

Please monitor 14.07045 (PSK-31) for normal 20m propagation and 50.62 (AFSK/FM APRS) in central TX
then Ok then KS and report any reception via http://www.kd7lmo.net/qsl.html.

Topic: 2877 Message: 2884

Thanks Mary --

PSK-31 on 20m 14.070.45 and FM APRS on 50.62. If ANSR-33 is still floating we are estimating it to
be over OK. However, there have been a lot of stations not hearing anything on 20m this morning.
The last report was at 09:36UT (3amCST).

Two-way QSO Distance

-- No entries --

Ref's comments:

--- I do not recall receiving a certificate or prize for winning the >50MHz telemetry reception
distance category in 2005 (via ORB-19). Did HABET (altitude), WB8ELK (flight distance and time),
KF4KJQ (HF telemetry distance via ANSR-28) or KC5TRB & KA9SZX (QSO distance via HABITAT SKYLAB)
receive anything? Telemetry and QSO honors were supposed to go to both the flight group and distant
participants.

--- ARHAB is both a ballooning and a communications challenge. Our contest results show interest
in all three ballooning categories, altitude, distance and time during 2005 and 2006. They are not
showing much interest in <50MHz telemetry reception distance (12-of-13 entries in 2005-2006 combined

were from me) or in QSO distance (only 3 entries in 2005 and none in 2006). ANSR and UTARC were the
only groups flying HF telemetry in 2005-2006. I haven't counted repeater/digipeater equipped
flights (that worked AOK) but it has to be very small number.

--- A few rules judgments could have gone the other way resulting in more flight disqualifications.
Closer judging of recovery efforts and adherence to flight and communications regulations is too
much work for one referee.

--- It is not clear to me what we are accomplishing with our annual contests. Is our level of
activity, or advancement of our state-of-the-art, or encouragement to experiment, or competitive
camaraderie significantly enhanced by annual contests beyond the value of our all-time record
keeping?

Ok, Please explain the disqualification's below of this class.
And This one we may have the record for. Yes it was before the days of GPS's remember we are one of the way back in the beginning old-timers. But there were many, MANY witnesses of the flight, many of you old-timers may even remember it! for many reasons. he he he. ugh!

It was launched at sunrise on dec 6th,, what year I honestly don't remember but it was precisely at 7 am,
The payload consisted of a in band and dual band 2 meter and 440 repeater, two meters and 440 inputs and 2 meter output.
And clock ossc beacons on EVERY band from 160 meters to 6 meters. so this baby had a signal coming out from it on EVERY band from 160 to 2 meters!
each band had a full sized dipole, made from ribbon cable. so it was two packages, the upper had the two and70cm receiver, (scanner) and it fed the audio from the receiver along down the ribbon cable to the transmitter box 130 feet below! This proved to be a mistake as we found out later. so this whole flight train from top of balloon to end of the lower dipole was close to 300 feet what a incredible thing to launch! i was sure glad we had absolutely dead calm winds at launch time.

Launch was un eventful. and soon people from all across the country were reporting the beacons. and making qso's through the repeater. This was before GPS's so positioning was purely by beam headings and triangulation. Launch site was from my home EN43xo

All progressed well this was also before the internet too, so the 40 meter net was up & running! we were getting reports from all over the midwest.

The rate of climb seemed right on nominal parameters by the reception reports and the people gaining access to the repeaters. The chase teams were in their usual waiting positions, somewhere down range near Madison,WI of course. waiting for it to come down and go and get it.

Position reports were coming in from locals as well as stations out on the fringes which of course were the most accurate. between all the stations reporting in those early days I bet we weren't too far off of the balloons location than we are now with the gps's. we just don't have altitude data.

Anyway this thing suddenly kicks into over drive and starts zooming past madison on a southeast heading. the chase crews take chase, and by the time they reach the state line of Illinois the balloon was like out pacing them by a factor of two, so they gave up the chase.

we got on the 40 meter net telling the people we have a runaway and to start organizing chase teams downrange. which many came out of the woodwork to give chase.

Ok we are thinking what's happening here. this thing should be on the ground soon if not already, yet the signal is strong and steady, a old time tell tale that the balloon is still inflated. it's now 11 am and still very strong signals. and we are starting to get some weird interference. were are hearing some voices in the background on the two meter downlink!

The two meter transmitter was locked on continuously, no cor board, anyway, the background voices are faint but clear. and getting stronger. what are they?

Actually it sounds like two different conversations in the background. what in the world? They are getting stronger.

position reports have the balloon over northeast suburbs of chicago, like 10 miles northwest of elgin. heading ESE.

we ask people on the repeater to hold the traffic so we can hear the other voices and see if we can figure them out.

They are getting up to about 25% deviation now and are quite easy to hear.

WOW! I know what that is! It's both WGN and WBBM am 720 and 780, both are HUGE signal transmitters in the northwest suburbs of chicago. The LONG 130 foot un shielded audio cable between the receiver and mic input of the transmitter was picking up the signals I'm guessing somewhat like a old crystal radio set! Oh well live and learn,, next time a rf link between the two or at least shielded cable!

Well at least we now knew the source of the mystery voices.

Well it's now Noon, and well past the expected flight time. We keep notifying Chicago center about the flight and they say they still see the reflector fairly well. so that's good.

conversations resume on the repeater. This is where we had an incredible QSO, the balloon was Over southeast Chicago, and a Station (who I do not recall or have a record of) but a station from Golden CO. called in, we made a QSO,, I thought WOW must be some duct or something that's over 900 miles from the balloon! thing is the best was yet to happen! about 15 minutes goes by and then a station from Virginia Beach VA. calls in! Holy Cow! over 700 miles away!

Now the best part was now the Colorado station calls back in and makes a contact with the virginia Beach Station!!!!!! ok Direct from Golden to Va Beach is 1596 MILES!!!! if you take the real path co to va via the balloon that's 1643 MILES!!!!! How's that for a record!? Yes there is no proof other than our memories, is there anyone else out there that remembers these conversations please let us know.

Anyway the balloon continues ese ward. And by all the position reports it is now crossing the IL and IN border. and continues on.

up here in EN43 we are still hearing it but it is getting weak, and hard to hear we tell the 40 meter net to have someone take over for us out there. Someone in Michigan volunteers. and we keep tabs on the thing via the 40 meter net. The crazy think hugs the IN and MI border and almost makes it to OH, then, yes this is December,, but it starts coming back!

It continues coming back, we start hearing it again from here and gratefully tank the MI station for taking over. we keep making contacts, and now WGN and WBBM start coming in again, and we expected this to happen again cuz it was getting close to them again.

It's getting close to sundown, and position reports have it right over Elgin IL. A buddy of mine Stu WB9UNX Lived near Elgin at the time, Went outside to get a possible visual. And THERE IT was! almost directly above his head, he is also an astronomer like myself and went and got his telescope and tried to see it.

Via the scope he could see the balloon,, but even through it it was still very small. he even took a picture of it through the scope. Then suddenly it vanished!

And we saw the telltale signs of falling payload. all the flutter and all that.

So the chase was on! We called Chicago center and told them it's on it's way, and they said they still see it, and it's going to be close.

How close no one ever expected!

Various FOX hunt crews from the chicago area got into the hunt. this runaway balloon was all the talk on 40 and from what I head on all the repeaters in the Chicago area. Its falling in a almost due east path.

Many teams are in the waiting, finally up here in EN43 we loose signal at 6:30PM,, for us that's a 11 and half hour flight, reports have it landing about 20 minutes later so total flight duration 11 Hours 50 Minutes missing the 12 hour mark by 10 minutes.

The ground hunt was ON! problem was,, all of the triangulation reports were placing the downed payload inside this HUGE fenced in area, with no way in.

Where was it? YIKES! it was inside OHARE! the busiest airport at the time in the country. We called Chicago Center and they said they saw it come all the ay down, and also figured that is was on the grounds. they made a call and had some security people meet one of the chase teams at agate and let only one of them in to retrieve the thing. They found it between two taxiways of American Airlines and Fed EX.

they got it, and brought the wayfarer home.

Like i said this was WAY before the internet , web pages, and GPS's,, but does this qualify for any records?

And how many of you old timers remember this crazy flight?

never did find out why it took so long for it to pop! but what a cool journey.

No proof other than memories, but if anyone else can also remember the above story will that qualify for this incredible record?

Joe:

That was a wacky flight, one for sure for the new guys. But it looks like Ralph's records are for 2006 only, not for all times. Ralph will probably post an updated explanation of his notes.

Mark, KA9SZX

2889. Re: [GPSL] 2006 ARHAB Contest summary

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-01 19:11:25 UTC
From: Joe
Topic: 2886 Message: 2889

Ahh,, didn't know for 2006 h h eh duh?

Oh well,, hey but remember that crazy flight? man that was a long time ago wasn't it/

Joe

2890. Re: [GPSL] 2006 ARHAB Contest summary

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-01 20:34:13 UTC
From: Ralph Wallio, W0RPK
Topic: 2886 Message: 2890

Joe --

2006 contest rules are at the bottom of our ARHAB Records page,
http://showcase.netins.net/web/wallio/ARHABrecords.htm. Rules for 2007 and beyond may be different.
Our ersatz conscripted ad hoc ARHAB august contest board will be discussing this ASAP:

Bill Brown, WB8ELK
Mark Conner, N9XTN
Michael Gray, KD7LMO
Mike Manes, W5VSI
Harry Mueller, KC5TRB
Stephanie Steele KC7DBA
Paul Verhage, KD4STH
Ralph Wallio, W0RPK

It is important to note that these rules apply only to our annual contests. They do not apply to
our all-time records. Required evidence of flight accomplishments from the distant past can submitted for our all-time records at any time. In our Records page RED is an all-time entry, BLUE
is an annual contest entry. In a couple of weeks all the 2006 entries will turn RED so that BLUE
can be used for our 2007 contest.

Now your questions:

-- What does the 24-notice rule mean?

It means I didn't proof-read close enough. The '24-hour' rule requires flights be announced a
minimum of 24-hours before flight. Announcement can be directly to our Balloon-Sked list and/or
sent to me for posting in our ARHAB Launch Announcements,
http://showcase.netins.net/web/wallio/ARHABlaunchannouncements.htm.

-- And what does the below mean? 2-hour telemetry rule? And web page info rule?

Telemetry has to be received and reported (not just transmitted) at no more than 2-hour intervals.
When an interval exceeds 2-hours the flight ends for purposes of contest distance and time.

Detailed information about a contest listed flight has to be available in an announced web page
within 30-days after the flight.

-- Ok, Please explain the disqualification's below of this class. [snip]

There are two record posting possibilities in your story, flight time and any QSO distance. For
flight time we need the date, launch and landing time and a flight name. For QSO distance we need
QSL-card type info from both stations including their coordinates. This means you will have to dig
up the callsigns, contact both stations for any given QSO and ask them to send me the information
(e-mail is ok).

This would be an all-time record entry for which the 2006 contest rules do not apply.

Hi Joe,

I think that's the same flight of yours that I witnessed pop over Stu's house in Elgin IL while I was visiting him.

I didn't know you were there, It had to be it, but i don't remember you being there.

sadly i have no records of any of it. i don't even remember what year it was, the only reason i remember the day is that it was pear harbor day. but thats about it.

2893. ANSR-33 Flight Summary

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-02 06:21:05 UTC
From: mgray@ess-us.com
Topic: 2893 Message: 2893

Thanks to all those that help to support the ANSR-33 flight. The final flight summary is posted to:

http://www.kd7lmo.net/ansr/ansr_33.html

If the payload is ever recovered, we'll post the Flight Data Recorder data set.

73s de KD7LMO

2894. Re: [GPSL] 2006 ARHAB Contest summary

First, thanks Ralph for all the hard work in keeping track of these records and posting them. Maintaining a web site is a fair amount of effort. Great job!

The contest has been fun for ANSR this year, but we did pretty well. The long duration stuff has been fun because it gets a larger number of groups involved in the flights and is a challenge.

Happy New Year to the group

2895. ANSR-33 map, Contest

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-02 16:56:09 UTC
From: K. Mark Caviezel
Topic: 2895 Message: 2895

Does anyone have a nice map snapshot that shows the position reports from the recent record setting ANSR-33 flight? I'd like to include this in my records of the flight.

Also: Ralph, thanks again for being the keeper of the records. It is a lot of fun, and I think the annual contest stimulates fun and experimental ARHAB activity.

- Mark Caviezel ng0x

2898. Ballooning contests

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-03 03:06:44 UTC
From: wb8elk@aol.com
Topic: 2898 Message: 2898

I think the contests are a good way to stir up innovation and activity....I know it always seems to spur me and a few others onward to toss one up at the very end of the year.

As per my previous thoughts on the subject in past discussions, I'd like to suggest removing some of the contest rules and restrictions for the 2007 balloon contests that often invalidate an otherwise valid yearly record and also keeps the record-keeper/judge (Ralph in this case) busy trying to sort things out. In other words, I'd like to suggest simpler rules so that we can spur more activity and participation and make it a lot easier on Ralph. The intent of the existing 2006 rules are well-intended but are often impractical due to vagarities of propagation, for one example.

I do like the advance notice rule to give enough time to post info for those who want to follow the flight but I'm not sure if less than 24 hours would give Ralph enough time to post. I guess an alternative would be to post on Balloon_Sked at least a few hours in advance might be an option?

Also...some groups or individuals do not have much of a web presence...so perhaps a rule to at least summarize flight results via a posting to GPSL or Balloon_Sked might be enough?

In any case...I look forward to a stellar year of ballooning in 2007 !!!

2900. Hydrogen & ARHAB

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-06 18:50:40 UTC
From: Harry M
Topic: 2900 Message: 2900

I checked on the price and availability of Helium here in Tulsa yesterday. It has gone up $10 for a K bottle and availability is not guaranteed. I also priced Hydrogen, which is $30 for a K bottle and readily available. I am strongly inclined to start using Hydrogen in the future.

I am soliciting comments from those of you that have experience using Hydrogen for filling wx balloons. I would like specifics on apparatus, materials used, grounding, precautions, pictures, web links, etc.

Thanks & 73

Hi Mark,

I've been doing a lot of INet searching and the safety measures needed are not very restrictive. In fact, having a container of gasoline in the vehicle is more dangerous. I don't have a problem transporting H2. Just a few adjustments like keeping a window open, not smoking and having a ground from the vehicle to tank to filler. One thing I have a question about is the cautionary in the MSDS that says..."Do not crack or open disconnected hydrogen cylinder valves; escaping gas may ignite spontaneously." I assume that a static discharge would be the third part of the triangle.

I have witnessed a fill at the NWS site in Norman, Ok. They have it setup to be an unmanned fill. The balloon is laid out on a table and attached to the filler, which is attached to a scale that's set to a predetermined amount of lift. The scale is attached to a shutoff valve. They turn on the H2 and leave the building. The fill room is isolated from the H2 tank room.

Harry,

We use hydrogen to fill the casing of our generators at both of the power plants that I work in. Hydrogen has much better thermal conductivity than air, so it's a better choice to keep the generator cool. A little hydrogen is 'scavenged' from the casing at all times in order to keep the purity above 93% and is monitored by a hydrogen purity analyzer. We use bulk hydrogen at one facility and cylinders at the other. The only danger, other than the obvious spark or flame, that we've been warned of is to never crack open the valve of hydrogen cylinder to atmosphere. I believe the concern is static build up around the nozzle potentially igniting the gas. Also, hydrogen burns with a nearly invisible flame, so it's very difficult to see.

Sounds like I should contact my local supplier about He availability for GPSL this summer.

73,

Rog KCØMWM

From: Joe
Topic: 2900 Message: 2904

All 30 flights we have had we have used Hydrogen, Never have had any
problems at all.

The only cost in changing I can see for you all is that the threads on
the bottle is left hand thread. So you will need a new regulator.

The explosive nature is far exaggerated. I've seen gasoline "Explode"
much more violently. We often fill huge trash bags with left over gas
and intentionally ignite them. A quiet orange ball of flame happens
that is just slightly bigger that the bag it was in.

Hindenburg,, if you ever watched that news film, it did not explode
either. Yes it burned, but the new theory is that the covering is what
burned, not the gas inside.

matter of fact the "Mythbusters" will be doing just this in a future episode

http://dsc.discovery.com/tvlistings/episode.jsp?episode=72&cpi=25369&gid=0&channel=DSC

I honestly am totally un afraid of hydrogen, In my opinion it's just
got a bad rap from hindenburg, and how much of that was anti NAZI
propaganda at the time?

from our experience I'd not be afraid to inflate one in my living
room, really,, your christmas tree is a thousand times more hazardous
that Hydrogen is.

but thats my 2 cents from experience.

Thanks for the comments Joe & Roger!

Joe, with He I normally use a plastic hose and PVC filler. What do you use wi H2? Do you use any grounding during fill? I'm not afraid of H2, like a good pilot or pyro, I would like to get all available info before I proceed.

Roger, your suspicions about static at the bottle agree with mine, although I have found no difinitive answer yet. I will be going to AirGas here in Tulsa this week and see what they have to say.

Same exactly, 1.25"PVC pipe at the balloon neck with hose clamp and
ballast weight attached. this goes into a 1/4"ID latex hose, that
after three feet or so adapts the the high pressure hose from the
regulator (comes with the high pressure hose,, but rarely use more
than 10 pounds of pressure when filling)

Do you use any grounding during fill? I'm not afraid of H2, like a
> good pilot or pyro, I would like to get all available info before I

nope, no additional grounding,, the Hydrogen is in the balloon! We
never NEVER touch the balloon itself, so, no chance of a spark even
if there was it'd have to penetrate the latex layer, and make a hole
that the gas inside can start to leak out, then you'd have to have a
second spark to finally ignite the mixture, hydroges itself CAN NOT
BURN,, it MUST be mixed with Oxygen.
>
> Roger, your suspicions about static at the bottle agree with mine,
although

When we filled the trash bags it usually was done without the
regulator and directly from the bottle, LOUD hissing sound,, but a
fast moving stream of "Air" makes a spark? whty?

I believe they use grounded fill lines, but other than that, it does look like they're not too worried about it. Filling out doors does sound safer, since there's no confined H2 to worry about.

Paul

>>> "Mark Conner" <mconner1@...> 1/6/2007 8:40:49 pm >>>
I have seen the same thing in the Omaha area in the last six months. I recently paid over $90 for a T cylinder - availability has not been a problem yet (they had 8-10 T's on hand last time). I think it was $73 about 15 months ago and $80 in June.

As most everyone knows, NWS uses hydrogen for their radiosonde operations. After watching a few fills and launches, I don't think they take a lot of excess precautions other than to prohibit smoking near the building. If they "lose" a balloon inside the building where they fill, procedure requires them to contact the MIC (I suppose to judge whether or not to go to the expense to fill another balloon based on the meteorological situation).

The main thing for me would be transport and storage. I keep two helium cylinders in my garage - I imagine I'd keep the hydrogen cylinders outside, but where I store them is (unintentionally) fairly well ventilated. I might consider having Linweld deliver cylinders rather than going to get them if I went to hydrogen (think it's about $5 here).

That's perzackly right, Harry. This is why SAR helicopters always dip the rescue harness in the water or on the ground before letting the victim touch it.

BTW, I don't think the fire risk with H2 is worth the savings, especially when most of our flights involve students who may be recruited to handle the balloon during a windy fill. And we commonly have to haul out 7 T bottles to a launch of 2 x 3000 gram bags. Lotsa bang there!

The H2 flame is invisible because there's very little emissivity in H2O - unlike Carbon. That doesn't mean the H2 flame isn't hot!

Subject: [GPSL] Hydrogen & ARHAB

I checked on the price and availability of Helium here in Tulsa yesterday. It has gone up $10 for a K bottle and availability is not guaranteed. I also priced Hydrogen, which is $30 for a K bottle and readily available. I am strongly inclined to start using Hydrogen in the future.

I am soliciting comments from those of you that have experience using Hydrogen for filling wx balloons. I would like specifics on apparatus, materials used, grounding, precautions, pictures, web links, etc.

Thanks & 73
Harry

Harry,

We use hydrogen to fill the casing of our generators at both of the power plants that I work in. Hydrogen has much better thermal conductivity than air, so it's a better choice to keep the generator cool. A little hydrogen is 'scavenged' from the casing at all times in order to keep the purity above 93% and is monitored by a hydrogen purity analyzer. We use bulk hydrogen at one facility and cylinders at the other. The only danger, other than the obvious spark or flame, that we've been warned of is to never crack open the valve of hydrogen cylinder to atmosphere. I believe the concern is static build up around the nozzle potentially igniting the gas. Also, hydrogen burns with a nearly invisible flame, so it's very difficult to see.

Sounds like I should contact my local supplier about He availability for GPSL this summer.

73,

Rog KCØMWM

As of right now you should be ok for July, the biggest problem is for the companies that use liquid helium in large amounts. As far as the price I have heard up to a 30% price increase by summer. I will know more by late March or April.

LINDE GROUP RAISES HELIUM PRICE effective Oct. 15, 2006

http://www.cryogas.com/news/gascompanies.php

The Linde Group announced an increase US helium prices 10 to
15 percent, effective October 15, 2006, or as contracts allow.
This increase will affect customers purchasing helium in liquid
dewars, gaseous tube trailers, high-pressure cylinders, and bulk
liquid containers. *Larger* price increases may apply to customers
who are not currently paying fuel surcharges. "This price increase
is necessary to offset the higher cost of purchasing and producing
refined helium," said Kevin Baudhuin, President, BOC Industrial
and Special Products, North America.

"The increased helium costs are the result of a growing reliance
on purchases of high cost crude helium from the U.S. Bureau of Land
Management (BLM), government restrictions on the flow of crude
helium feedgas through the BLM pipeline and the higher cost of
refined helium purchased from third parties. Crude helium from the
BLM's stockpile is playing an increasingly important role in the
helium supply chain as crude helium production from lower cost
private sources declines due to depletion of some of the key natural
gas fields that contain helium," Baudhuin explained.

Associated Press Sept. 11, 2006

See entire story at http://www.msnbc.msn.com/id/14791165/

CLEVELAND - This gas shortage won't hurt you at the pump, but you
could find it a little deflating at your next party.

The world's supply of helium has taken a hit because of delays in
getting plants on line, U.S. officials say. Suppliers of the
lighter-than-air gas have raised prices, and some party-supply
stores have had to cut back on their balloon business.

A key issue in the shortage involves contracts for helium from a
Qatar plant and two in Algeria that been off line, said Hans Stuart,
a spokesman for the U.S. Bureau of Land Management. One overseas
plant has been involved in lengthy maintenance and two are behind
on construction schedules.

The BLM, which manages more than 400,000 square miles of public
land, mostly in the West, provides more than one third of the
world's crude helium, selling it to private plants for processing.

I went to AirGas today and they will not sell me H2 so I went to 3 other welding supplies and they had no problem selling
it to me. Price is 196 cu/ft $24 - 261 cu/ft $34 and a single stage H2 regulator is $150-$175.

One of these suppliers is where I bought my He regulator and they will sell me He T-tanks for the price I had been paying at my regular supplier ($65), even though the regulat price is $90. I was also told the price of He went up because of Valentines Day and theprice was expected to fall again in late February. Typical case of supply and demand (Gouging as I see it)! At this time none of them have a shortage of He and don't see any in the future.

I made a calculation several years ago assuming the ideal gas law. H2 gave 8% more lift. If the ideal gas law holds up, you'll just need to decrease the initial fill of gas by 8%.

One man's answer to the question of practical performance differences between He and H.

Density of He at sea level and 15dC: 0.1785kg/m^3 For H: 0.0899kg/m^3

Assuming 6lbs of load on a 1500g balloon (total 4.2216kg):

7.0m^3 (247ft^3) of He yields initial ascent rate of 931ft/min at sea level and 15dC

5.59m^3 (197ft^3) of H yields the same ascent rate, 931ft/min

The He filled balloon is predicted to burst at 97kft

The H filled balloon is predicted to burst at 102kft.

These answers come from my balloon performance spreadsheet based on U.S. Standard Atmosphere.

I've figured that the tracking it's self doesn't need any tweaking. But I'm thinking that I'm going to have to change the on-line ascent rate calculator to account for HE or H2. I haven't really dove into it yet.

Well, on 2nd thunk, since H2 yields more 8% lift for a given volume, then
the balloon would be 8% less volume and about 5% less drag area. So
one would get a faster ascent for the same excess lift fill using
H2 vs He. Not that any of us can repeatably fill to 1000.0 fpm!

I agree with Pat. Unless, of course, you've managed to garner
liability insurance for your group - in that case, please let
me know who's your underwriter and the approx annual premiums!

BTW, natural gas (methane) will lift, but it's a LOT heavier
than He, so you'll need a lot bigger balloon, the cost of which
is likely to consume a goodly bit of your savings on the cost
of the lift gas - assuming you don't ignite it ...

From: Mark Conner
Topic: 2930 Message: 2931

I checked into them a few years ago at the time I was looking for
something beyond a BS2sx. Based on the reading I did, there were some
questions regarding the roubustness of the compiler - the processor
would hang or otherwise do unexpected things for no apparent reason.
Not sure how much credence to put in those reports, but I ended up
going with the BS2p when it came out shortly after I was looking at
all this.

I looked at th BasicX and it didn't look like all that much bang for the buck. The Ardino looks promising but I don't much care for the language, though the IDE is Open Source (a real plus in my opinion). The Basic Atom doesnt have much of a user base so there's not a lot of code out there. However, the code is VERY similar to the the BSII. And the Atom has 360 bytes of RAM on the cheap version ($39) and 2k on the "Pro" version ($60) . Plus it's got hardware a UART, a builtin ADC, an interrupt and there's a version that's pin compatbile with the BS II. Compared to the BS II, it looks like a lot less hardware interfacing.

The lack of RAM in the BS II is the real motive for me to look around. I want to use Spark Fun's SD datalogger to log literally everything and there's just not enough RAM to shove it all through the BS II or 2p. I also want to start communicating between flight modules with Sparkfun's little 434mhz rf modules and the the BS line is starting to run out of gas.

Of course, I'd rather use a gumstix ('ARM' based linux computer about the size of 2 packs of gum) and do it in perl, but the thing eats too much power.

Last year we had one of the guy's lauch a PC-104 ARM based computer that will run linux, though he used BSD. It's a power hog too, but seemed to do okay. The perl libraries that came with it were awesome.

I'll probably buy one of the Atom OEM kits ($39) an see what it'll do. If I get time (HAH!), I'll see with the PC-104 will do also.

I use the BS2p. It has a scratch pad large enough to store an entire GPS sentence. Then I have the Stamp step through the stored sentence and pull out what it needs.

I ran accross this this Meteorological Handbook No. 3 while searching on google. I thought I would let folks know. Might be that you all have stacks of it on the shelves already. But if not, its a lovely 191 page read (like I read it all - lol). B.5 on Page 82 as counted by Adobe Reader talks about some of the safety precautions gov. agencies are to use when dealing with hydrogen.

Done!

Folks, these are the same make, model and version that EOSS's has
been using for some time now. Good for 130,000 ft MSL and full
set of NMEA-0183 sentences at 4800-8N1 TTL serial interfaces directly
with KPC-3+ or TT3. Not bad for $10 @ qty 5. Runs on +5Vdc @ 150 mA
and supports gain antenna, altho works fine with passive quad helix.

Check Synergy GPS and the AR-05

http://www.synergy-gps.com/content/view/25/48/

http://www.synergy-gps.com/images/stories/pdf/antar-05_tn880.pdf

They have an option for a RA OSX on that model. Very small and low power
as well. I think they still offer a 10% ham dicount.

Dumb question - are OSX and MCX the same connector type? Seems to be, but I can't tell for sure.

It appears there's a size difference between MCX and MMCX, but haven't found anything saying so explicitly yet.

Yes, OSX and MCX are the same. I think the OSX is the trade for M/A Com
or Omni-Spectra.

MMCX is the small version of the original MCX.

Here is a good link for all the different types:

http://www.microwaves101.com/encyclopedia/connectors.cfm

MicroPulse may still be making the pill bottle quad helix antennas that they built for VIZ radiosondes. I clip of the flex circuit feedline and replace it with a short run of RG-174 coax. DigiKey or Mouser should stock the OSX connectors. They also have the 2x10 2mm sockets for the Jupiter header.

Hi Roger,

Still uncertain about actual totals for EOSS at GPSL 07, but my best guess is that we'll be showing with about 10 folks (+/-) for the Friday conference and Saturday launch. The buffet will be fine.

If you're arranging for Helium, we'll be using one T-bottle and would appreciate having a spare on hand in the unlikely event of a mishap during fill (best to keep Murphy at bay!).

Will keep you posted as more members firm up their plans.

It is a nice launch, but I still don't think the calm winds are
justification for going sans-gloves... :-) Rope burns suck.

2949. GPSL 2007 Convention Center Layout

Yahoo group: GPSL (2002 — 2008)
Date: 2007-01-27 00:11:57 UTC
From: Roger Hammond
Topic: 2949 Message: 2949
Attachments: 1 described; binary payloads are missing from this source WARC

I had a request for a floor plan of the hotel / convention center. I've attached a .pdf of that document. The original they sent me was a .doc and was something like 9 MB! I thought everyone might appreciate something smaller, so I converted it before resending. Anyway, hopefully this will answer any questions. Conference is slated to be in the Cottonwood Room. Lunch will be in the Cedar/Locust Room.

Also, the group room rate of $65.95 is good Thursday, Friday, and Saturday. I'm checking to see if they'll honor that on Sunday, as well. Hopefully we won't need the weather day, you might all grow tired of Grand Island by then.

Roger,

Did you find out if there was WiFi access in the conference room?

Will we have tables with chairs in the conference room, just chairs, or what? If we have tables, it might be worthwhile to bring some extension cords and power strips so people can plug in their laptops. I can probably round a few up from home and bring them with me if needed.

Edwards AFB has made major changes to their web pages (http://www.edwards.af.mil/). One result is
that access to aviation weather information from the 412th OSS Weather Flight has moved to https://bsx.edwards.af.mil/weather/noframes.htm. Computer forecast models are now available via
https://bsx.edwards.af.mil/weather/models.htm.

One model product family of particular interest to ARHAB is Global Forecast System (GFS) CONUS winds
aloft wind barb charts now available via
https://bsx.edwards.af.mil/weather/avnmodel00.htm.
Forecast charts are available in 6hr increments out to 72hrs, 5,000-102,000ft (FL050-FL1020).

Mark,

During my first meeting with the HOJO rep, she said there was WiFi throughout.
The conference room will be set up in a classroom format with tables and chairs.
I might be able to scrape up a plug strip or two, I might ask the hotel if they have any available, as well.

From: Roger Hammond
Topic: 2971 Message: 2971

Hello everyone! As we get a little closer to the conference date, I thought I should try and get a few more details ironed out. It was unanimous that we go with the buffet for the conference luncheon. I uploaded the buffet choices to the files area this morning in the GPSL 2007 folder. Rather than to ask everyone their opinion on what should be included in the buffet, I thought I would come up with a plan and then see if there was any serious opposition. Here are our suggestions based on past experience (they catered our wedding reception in 2000) and making an attempt to offer some choices for those with dietary concerns.

2 entrees:
MeltAway Pot Roast and Stuffed Chicken Breast

2 salads:
Garden Salad and Fresh Fruit Bowl / Tray

3 sides:
Baby New Potatoes, AuGratin Potatoes, and California Medley

If you have a strong opinion one way or the other, feel free to email me on or off list.

****
****

We're leaning towards a Mexican restaurant for the Thursday evening meal. El Tapatio is just a little north of the Howard Johnson and is one of the local favorites. The Friday evening meal will likely be at a local Italian / Pizza place, Valentinos. Valentinos is a Nebraska-based chain that offers a buffet including pizza, pasta, salads, tacos, and desserts. I'm still trying to figure out what and where for the Saturday meals.

Looking forward to seeing you all in July.

2978. Re: [Balloon_Sked] Floater with 10m beacon aloft - estimated to be over Maine

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-15 22:33:01 UTC
From: wb8elk@aol.com
Topic: 2978 Message: 2978

Mark,

10 meters is not open at this time, but if you listen to 28.200 through 28.300 and hear the propagation beacons, then the band might be open..it's hit and miss now during sunspot low doldrums....only direct line of sight reception reports are coming in mostly from Maine. I estimate from my estimated ground tracks and reception reports on APRS digipeaters as well as ground stations on HF that it is currently over Maine....probably floating around 20,000 feet based on how it's tracking the prediction plots and also the external temp readings.

Here's the info on the balloon.

By looking at the Raw Data on Findu....Robert'By looking at the Raw Data on Findu....Robert'<WBR>s balloon is still flying and approaching New England from the looks of the digipeaters New England should listen to the 10m CW beacon on 28.636 MHz (currently best heard on 28.635 MHz). It was still flying as of 6:23 pm EDT and is estimated to be in Maine. We could use some beam headings however to try to narrow the location down since the GPS is not working.

One trick might be to look for the 5th harmonic of the 10m signal on 143.18 MHz and track it with a 2 meter beam...but it will be weak.

Raw Data on Findu from 144.39 APRS (callsign KC8UCH-11):

http://www.findu.com/cgi-bin/raw.cgi?call=KC8UCH-11&time=1 (http://www.findu.com/cgi-bin/raw.cgi?call=KC8UCH-11&time=1)

The 10 meter beacon has the callsign: KA2QPG and transmits as follows:

Telemetry format (sent every 2 minutes) :

DE KA2QPG BLN GPA/SD2 UP 14H34M A 033 T NEG 55C L 204 B 8.7V EMAIL PT AT _RIFTON.COM_ (http://rifton.com/) AR where: UP = flight time in hours and minutes a = altimeter (absolute pressure

[higher # = lower alt], 0 - 255) T = outside temperature (-99 - 99 degrees C) L = light level (0 - 255, uncalibrated) B = battery voltage (0.0 - 9.9 volts)
The remaining time in the 2-minute cycle will have a Morse "dit" and a beep of the piezo sounder every 4 seconds.

2979. Balloon estimated now to be on the Maine - New Brunswick Canadian border

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-15 23:57:33 UTC
From: wb8elk@aol.com
Topic: 2979 Message: 2979

Based on reception now by a digipeater in Prince Edward Island and only Nova Scotia digis....I'd say it is right on the border with Maine and New Brunswick, Canada....my altitude estimate based on the external temperature of -41 C would indicated that the ballast did indeed work and it's now floating at 29,000 feet...probably will do so all night and all the next day until sunset tomorrow....so Europe...look out for this. The flight path will take it over New Brunswick and then to Newfoundland later tonight.

The APRS transmitter is showing -40 C internal temp and batteries are freezing up and getting low...it just recently reset and now shows a position in Tokyo, Japan.....however, the GPS is not working and hasn't worked throughout the mission. Who knows, he may eventually go to Tokyo.

The 10 meter beacon is still being received in Maine on 28.635 MHz as of 2356z.

- Bill WB8ELK

2980. KC8UCH balloon appears to have landed

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-16 02:33:47 UTC
From: wb8elk@aol.com
Topic: 2980 Message: 2980

At 0206z, the balloon appears to have landed as it dropped out of the digipeaters in New Brunswick and Prince Edward Island at about the same time. The inside temperature was just about at outside ground temps so it very likely has landed or is about to do so.

The KA2QPG 10m beacon was working well and should still be operating for quite some time...so listen in on 28.635 MHz and if the band opens up, you might hear it the next few days. I would estimate it has landed between St. Johns, New Brunswick and Prince Edward Island.

73s de Bill WB8ELK

Raw data link on Findu:

http://www.findu.com/cgi-bin/raw.cgi?call=KC8UCH-11&time=1
(http://www.findu.com/cgi-bin/raw.cgi?call=KC8UCH-11&time=1)

By the way, Appending &time=1 gets you the time that digipeater hear the signal

2982. CBC story on lost high-altitude balloon in the Maritimes

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-20 18:13:21 UTC
From: mconner1@gmail.com
Topic: 2982 Message: 2982

This story is regarding Robert KC8UCH's recent flight.

73 de Mark N9XTN

==========

http://www.cbc.ca/canada/nova-scotia/story/2007/03/20/nb-balloon.html

New Brunswick amateur radio operators are on the lookout for a high-altitude balloon believed to have come down somewhere in the Maritimes, after being launched as an experiment by a Michigan Grade 5 class.

2983. Balloon Launch

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-21 02:43:27 UTC
From: David Wilson
Topic: 2983 Message: 2983

Greetings all, It was great to hear that the KC8UCH flight may be found soon. I belong to a Canadian ARC known as NPARC (Niagara Peninsula Amateur Radio Club)and we are in the process of putting together our first package. The balloon will have 115 cuft capacity and a lift-off weight of 5 ponds.The payload telemetry will consist of battery level and
outside temperature, which will be sent to the ground on a 2meter link. There will be a second FM transmitter sending the pulses for detection when the payload is jettisoned. It will also operate in the 2 meter band.
There will also be a digital camera set to take a video of the take-off and run until the memory is full or the unit freezes up (whichever comes first).
The payload will be dropped from the balloon on a signal from ground and hopefully recovered intact.
I am interested in the battery supply others are using. Naturally we need as much mah as we can get with the least weight.
what type have others used? Any help and input would be greatly appreciated.

cheers David ve3bbn

David,

Perhaps the easiest and most readily available batteries I can recommend is the lithium AA batteries you can find just about anywhere such as Walmart or Lowes....a very complete datasheet link follows:

http://data.energizer.com/PDFs/l91.pdf
(http://data.energizer.com/PDFs/l91.pdf)

Just package them up in some battery holders from Radio Shack and you have a nice lithium pack that's a lot easier to build up than hacking into the old military lithium packs....and a lot safer too.

Hi David,

Good luck on your ballooning efforts.

I have used nothing but Eveready Energizer 9v batteries for all my power needs up to this point and have never had any problems. I have used them in serial and parallel configurations. I did use an Eveready 6v lithium camera battery one time. One of the two cells ruptured due to the lack of pressure at altitude.

Cool!

One of the sticky points may be consideration of what happens
if your balloon drifts across the US border. I think that it
would need to comply with the US FAR (Federal Air Regulations) Part
101 [3]:

<http://ecfr.gpoaccess.gov/cgi/t/text/text-idx?c=ecfr&sid=8b5584c0cf53c0a4f4a5615491e1be66
&rgn=div5&view=text&node=14:2.0.1.3.15&idno=14#14:2.0.1.3.15.1.9.1>

Do you know what the Canadian equivalent is (and have a link) [4]?

[3] And, one certainly hopes that it wouldn't land in Boston, since
it would almost certainly be regarded as a terrorist device and
exploded. :-(In any case, it probably would be a good idea to
label the package really well.

[4] This is more than just idle questioning, since I have relatives
in Canada, and might want to expose them to the joys of balloon
launching one of these days.

> The balloon will have 115 cuft capacity and a lift-off weight of 5
> pounds. The payload telemetry will consist of battery level and
> outside temperature, which will be sent to the ground on a 2meter
> link.

Sounds like a good start. Some other things you may want to think
about for future launches would be things like battery temperature
(which would indicate how well your insulation is working),
illumination levels (How much brighter does it get as you go
up [1]?), and humidity levels (although this is probably moot once
the temperature drops below freezing) [2].

[1] This will probably require an integrating sphere to minimize
problems with light directionality. It might also be interesting
to measure UV versus visible (versus infrared?) levels, too.

[2] And, this may not be something that's easy to measure.

> There will be a second FM transmitter sending the pulses for
> detection when the payload is jettisoned. It will also operate

> in the 2 meter band.

Seems to be a reasonable band choice. Will the dropped payload
have a GPS unit on it, or is it to be found with RDF (Radio
Direction Finding) only? I'm assuming that the dropped payload
will float down via parachute (Glider?).

> There will also be a digital camera set to take a video of the
> take-off and run until the memory is full or the unit freezes up
> (whichever comes first).

Should be some interesting pictures/video.

> The payload will be dropped from the balloon on a signal from
> ground and hopefully recovered intact.

What's the drop mechanism?

> I am interested in the battery supply others are using. Naturally
> we need as much mah as we can get with the least weight.

Once you have some ideas, it may be a good idea to test some of
the packages by tossing the payload in a deep freezer to see how
much voltage drop you get at decreased temperatures. That may also
give you an indication of how well any thermal insulation is working
for the payload package.

For that matter, it might also be a good way to test the
drop/cutdown mechanism, since mechanical things tend to not work
well at the extreme cold temperatures found at altitude (and, we'd
all hate to see your payload floating out over the Atlantic, never
to be seen again!).

> what type have others used? Any help and input would be greatly
> appreciated.
>
> cheers David ve3bbn

In any case, best of luck to your launch.

IANAL (I Am Not A Lawyer):

One approach is to incorporate your club, and use it as a liability shield against suits (If you get sued, then they may win the suit, even by default, but the liability is limited to the assets of the corporation.).

Another approach is to launch under the auspices of a government body (school/state university/etc.), under the assumption of sovereign immunity (although there are a LOT of restrictions on this):

http://en.wikipedia.org/wiki/Sovereign_immunity

Of course, both of these approaches have problems, and the laws almost certainly differ greatly between countries (and even states/provinces).

You may also want to talk to your insurance agent about specific coverage, or a blanket/umbrella policy to cover your activities.

In any case, be certain that you comply with all of the appropriate laws.

Dave
WA4QAL

P.S. I am still not a lawyer, so any advice I've offered (along with about US$5) will get you a cup of coffee in some places. :-)

David --

To my knowledge no group has acquired liability insurance for their flights. A few groups have
investigated the possibility but all have found premiums to be too high to accept. (Groups: If
there are exceptions to this please post your insurance information.)

Insurance available to ARRL members does not cover high altitude ballooning. Several years ago AMA,
the American Modelers Association, did not want to consider the possibility of covering amateur high
altitude ballooning.

I have been told that homeowners insurance would cover claims against individual policy holders (not
groups) resulting from high altitude ballooning. I asked for and received letters from my agent and
insurance company stating same. However, I have not heard of others having a similar experience let
alone actually having a claim paid.

Employees, even part time employees, of school districts, colleges and universities are covered by
their liability insurance. The situation is not so clear cut for volunteer advisers to institutional high altitude ballooning programs. I have asked for and received letters from institutions stating that their liability insurance would cover my volunteer participation.

I looked into insurance coverage specifically for balloon flights....we were looking into insurance for our last rockoon flight over the ocean....(rocket fired from a balloon at 70,000 feet).....however, the insurance costs estimate for this mission was about $3000 or more per mission, but this was a very large balloon (512,000 cubic feet zero pressure and a 300 pound rocket)....this was from a company in Texas that does insurance specifically for scientific ballooning...smaller ARHAB style missions may be quite a bit less to cover...I will try to find their information and will email to you. I've been told that Lloyd's of London will also do insurance but expect the cost to far exceed your payload costs. I think the homeowner's policy letter might be the best way to go....and affiliating with a local school or university is a very good idea and would most likely cover you....contact them and see if they want to fly an experiment with you. I help volunteer for the local University here as they do a special Balloonsat class for senior EE students which gives them hands-on experience in design and practical application...it's considered their senior design project.

The way most groups do it, is to stack the odds in their favor by looking closely at the Balloon Track predicted flight path and make sure your launchsite keeps your landing site away from any large city or town. Balloon Track can be downloaded from the EOSS website: _http://www.eoss.org_ (http://www.eoss.org) You can also use the online BalloonTrack at: _http://www.nearspaceventures.com_ (http://www.nearspaceventures.com)

Hi David,

GL on your first flight! Sounds as though you have the right set
of beacons, but what freqs will they be on?

LiSO2 primary cells have proven to operate quite well in balloon
payloads. They have excellent energy density and low-temperature
tolerance compared to other chemistries. You can buy them new as
CR123 Li camera batteries, or more bang for the buck as surplus
BA-5513/U batteries - the individual cells operate at about 2.7
at 500 mA load, and can be trusted to give you at least 4000 mAh. Not
bad for 85 gm per cell and US$2 per cell. A camera store in NYC
sells them, but can't recall the name - try Googling BA-5513/U.

I assume that you have a parachute for your descent? A 1.8m diameter
conical should be about right for that payload. If you want to get
the payloads back, recommend deploying a recovery team around the
landing site as predicted by WinBallTrack, downloadable from
www.eoss.org.

Hi Ralph, nice to hear from you. I am starting to be concerned about the happening of this flight. People nowadays are so scared to do just about anything that can come back to bite them. I guess in a sense all the insurance in the world wouldn't cover the downing of a 767 or the likes of it. i know there hasn't been an issue like this happening but they would be afraid they would make the Guiness book of records by bringing down an aircraft with a balloon.

Project: Traveler has always had $1M liability insurance for our
flights. We found a local agent (sorry, he's only licensed in Kansas -
we've checked) that would write a general liability policy for the radio
club, which we flew under. I believe it cost us about $250 a year for
the coverage.

Hi David,

EOSS doesn't carry liability insurance for its
balloon operations. We've sought it out several times
in the past, but only Lloyd's of London returned a quote of
absurd annual premiums. So we are self-insured. We limit
our liability, however, several ways:

1. We are Colorado and Federal non-profit corporation, thus
granting us significant protection afforded non-profits under
Colorado tort law.

2. We take care to avoid posing risks to others and their
property. Most importantly, we keep our local FAA controllers
advised of our flight operations, posting HiBal notices a
week in advance, maintaining cell phone contact with them
during the flight and providing them near-real-time position
and altitude reports via our APRS beacons being I-gated to
findu.com and appearing on the control floor in FAA vernacular:
VOR radial and range. In addition, we won't launch if the
predicted trajectory will land us in a populated area or take
us through heavily-trafficked air corridors.

3. When we perform flight operations on behalf of colleges
and Space Grant, we do get some liability protection under
their policies.

Now, how much risk are we biting off? After 115 flights in
16 years, we've never harmed anyone, although we've taken out
some rural electrical power when landing across power lines.
And the only 3rd party accident related to any US ARHAB ops
that I'm aware of was a cracked windshield when a payload
string landed across an interstate highway; the driver called
the cell phone number on the payload placard, was compensated
on the spot and the payload string recovered with no further
ado. One hit in perhaps 1000 flights ain't bad odds, but
the results could be a lot worse.

Hope that helps take the white out of your knuckles.

Hi David,

Our 'chutes are made from ripstop nylon - not sure of the denier. A
2m diameter 'chute should weigh no more than about 500 grams, tho.
And be sure that there's a generous vent at the apex: 10-15 cm diameter
should do it OK. This helps prevent instability at high altitude.
Use dayglow orange material which enhances visibility during descent
and on the ground. Some of our 'chutes have alternating orange and
white gores.

The apex MUST have some means of attaching the balloon lift line as
well, and that should be plenty strong.

And be sure to fit a spreader ring about halfway up the shroud lines
to ensure proper 'chute opening. Ours use 7 mm diameter wicker, but
any lightweight flexible material will do. A hula hoop is suitable
for larger 'chutes - or maybe you could use a cut-down hoop?

You can probably find a suitable ready-made parachute from model
rocket suppliers. Spherachute (sic?) here in Colorado has made
several for EOSS. You may have to add or enlarge the vent and
add a spreader ring, tho.

3002. Lithium battery pack sources

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-22 01:33:21 UTC
From: wb8elk@aol.com
Topic: 3002 Message: 3002

David,

The website for the surplus military BA-5590/U lithium D-cell packs is:

http://www.sg-photo.com/ (http://www.sg-photo.com/)

They basically bought up a bunch of surplus BA-5590/U military packs and make up long duration packs for professional photographers...however, they used to sell the entire military packs quite reasonably to the ham balloon groups.

However...I'm not sure if they have any left, I'd call them to find out....they used to sell for between $15 to $30 a pack. There are 10 lithium D-cells inside....2.7 volts under load and rated at 7.5 Ah...but they are dated from the late 80s, so their capacity is probably around 5.5 to 6.0 Ah by now....so I'd check each cells voltage and maybe test one under load to see if they are still good. These packs are easy to disassemble as they are cardboard covers...just be careful not to short out any of the leads as these will produce e nough amperage to melt through your cutters (hmmm...voice of experience <smile>).

I have one of these packs still inside one of my first payloads that I flew in 1988 and it still powers up the payload just fine.

I typically use between 3 to 5 of these cells in series depending on the voltage you want. By the way, they are SAFT model LX3457 LiSo2. You can also find other BA-5590/U surplus packs on the internet...but be forwarned that some of these are encased in a plastic housing that takes a Dremel tool or hacksaw to open and is tricky so as not to saw into the batteries just below the surface (remember what I mentioned earlier about the cutters)...I prefer not to fool with these unless you want to fly the entire 2.2 pound battery pack...which will give you a bit less than 15 volts at 15 Ah. You can buy the individual D-cells new by the way...but they are typically $12 or more per cell but buying in small quantities is not easy to do as the distributors usually only want to deal with large volumes.

By the way.....years ago, Mike Batley at Avex Portable Battery used to make me custom SAFT battery packs using new SAFT batteries....he did all the hard work of professionally welding the battery tabs together and then heatshrinking it into a very nice and professional pack with wire leads coming out....and very economical...not much more than the new price for the cells actually...here's the link to his company...now called Avex Electronics...you might see what they have to offer now:...tell him it's for ham radio balloons and that I sent you and see what you can work out.

http://www.avexelectronics.com/batteries.htm
(http://www.avexelectronics.com/batteries.htm)

I also can't forget to mention that lately some groups have successfully used the new Lithium Ion packs designed for electric R/C planes....Thunderpower is one such manufacturer....these have great capacity....very lightweight....low temperature capable...AND....they are RECHARGEABLE...for at least 500 cycles or more. So, as long as you have a good recovery plan in place...these can really pay off in the long run and they are already assembled....just be sure to use the recommended lithium battery charger.

If you can't find any of these wonders....then the lithium Eveready L91 at Walmart is a good alternative and are shaped just like a AA battery and the same terminal voltage as AA's as well.

And yes, as Harry points out...you can indeed use standard batteries as long as you insulate things well...but they tend to be heavier than the lithiums for the same capacity and if it gets down much below zero inside your payload, then you've got problems....the AA lithiums will go below -20C and the military D-cells work even at -40C below....keep in mind it's typically -60C outside in the jet stream region even in the height of the Summer and goes up to a toasty -40 C at 100,000 feet. It really depends on the average current drain on your payload (and peak drain) and the amount of time you want everything to function....I'd recommend having at least a 6 hour lifetime goal so you have time to track it down after landing as the typical flight lasts about 2 hours.....If you have a backup beacon....then you can get by with a lower capacity for the primary payload.

I typically use add a 2m FM CW or voice beacon to my flight train that puts out about 50 milliwatts and run this with a lithium 9-volt battery surrounded by 3 layers of clear bubblewrap....the whole payload is 3 ounces including battery weight but will run for 28 hours. The clear bubblewrap combined with solar heating keeps the battery warm enough during flight. Harry KC5TRB makes a very nice beacon kit he can tell you about for this purpose....and there is one you can get from Doppler DF systems called the Microhunt (CW) or the Squawkbox (voice message).....in any case...having a backup beacon is great insurance in case you need more time to track on the ground and once the main payload dies out. I've also made beacons with 28.322 MHz cheap clock oscillators keyed on and off with a microcontroller to generate CW (they typically put out about 50 milliwatts) and can be heard for several miles when on the ground....I can also send you a circuit to AM modulate one of these as well which I plan to use for my next flight putting out CW and RTTY telemetry. If you don't filter the output of these, you'll get a weak output on the 5th harmonic...in this case 141.61 MHz which you can track with a 2m HT and a beam when you get within a quarter mile or so....you won't even need an attenuator and can usually walk right up to the payload.

Hope all this helps,

- Bill WB8ELK

Topic: 3003 Message: 3003

The company Mike referred to makes very nice and reasonably priced parachutes....they do them for model rocketry and they are very lightweight....just tell them you need a reinforced attachment loop at the top of the parachute where the vent hole is located so you can tie your balloon to the top of the chute. They will customize the color and even do multiple alternating colors...they've worked well for me and have been of very high quality and performance.

http://spherachutes.com/ (http://spherachutes.com/)
(http://www.spherachutes.com)

Of course, you can make your own as well using ripstop nylon.

3004. Liabilty and risks

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-22 02:07:14 UTC
From: wb8elk@aol.com
Topic: 3004 Message: 3004

I see that I didn't post my last email to David about liability to GPSL.

There have been approximately 1000 amateur radio ballooning flights since 1987 and in that amount of time only one incident with a cracked windshield caused by a payload hitting a car on a highway in Kansas which was about one in a million odds...(the car owner was given the money on the spot to buy a new windshield and no insurance companies got involved)....also one landing at O'Hare (they knew that it was incoming so no problems), even O'Hare security helped the chase crew to find it and recover it.

As for me after being involved with 200 flights or so....a landing in Boston Harbor (landed next to a speedboat who recovered it), a near miss on my chase plane (who was intentionally trying to get as close as he could...perhaps a bit too close - you can see the airplane wing on the ATV video as it whooshed by)....and our local university's Balloonsat last year landed on top of an apartment building's roof in a small town. Besides a curious woman on the balcony who told us she heard a big whomp on her ceiling, there were no problems and just a few fascinated folks staring at it. That particular small town (Rainsville, AL) seems to be a balloon magnet (it's about 40 miles east of our launchsite)...we've landed 2 right in the town limits and about 5 others within 3 miles of there.

Plus, the National Weather Service has launched many many thousands of radiosondes over the past 50 years....Two a day from 72 launchsites in the US alone....and they have never had a problem or incident with aircraft strikes or ground hits as far as I can tell.

So...the odds are pretty good that you will not have a problem as long as stack the odds in your favor with a good prediction that avoids cities and heavily populated areas.

I've starting to work out the details for the 20th anniversary of my first flight....I am currently planning on holding it the morning of Saturday, August 11th, 2007 from a farm near Findlay, Ohio...probably the same location as my first flight at WA8HDX's QTH.

I would like to invite any balloon group to come fly at this event ala a GPSL-style multiple launch and recovery.

I'm just in the planning stages of the event now and would like a quick show of hands of those who are thinking of attending or flying that day. I can do a group purchase of helium to make it as reasonable as possible.

That part of Ohio is ideal for flight and recovery...mostly perfectly flat farmground with few trees.

I'll announce more details as we get nearer to the date on my website:

http://www.wb8elk.com (http://www.wb8elk.com)

Subject: Re: FAA notification for RAOB flights(?)

Dear Mr. Wallio,

Thank you for your note requesting information on National Weather Service (NWS) Radiosonde launching policy

I suggest you contact someone in the FAA to get more information about FAA policy on balloon payloads. Steven Albersheim, FAA, may be able to help you. His email address: steven.albersheim@... .

The 92 National Weather Service upper air stations do not file NOTAMS because we meet FAR 101 rules as you pointed out. However, NWS offices within 5 miles of a controlled airport must contact the FAA Tower and request permission to release the balloons carrying a radiosonde.

I strongly suggest that you have a plan in place on handling mishaps that may occur when your payload hits the ground. This is not covered by FAA rules. Parachutes, balloons, and other flight equipment don't always perform as expected and NWS has been held liable a number of times for damages and injuries incurred from descending radiosondes. Damage claims have been submitted for broken car windshields, injured and killed and farm livestock, and minor injuries to people, just to name a few. NWS attorneys handle these claims.

Also, I have gotten a number of reports over the years of police/fire departments needlessly responding to a fallen NWS radiosonde. Many times the area is evacuated and police/fire department resources are wasted. Sadly, the Oklahoma City Bombing and September 11 have made this kind of response to a fallen radiosonde a more common occurrence. So, I recommend that you put a BIG, easy to read label on your payload noting that it is harmless and include a contact cell telephone

number. It may help, especially if your team is delayed when retrieving the payload.

Sincerely,

Bill Blackmore

Surplus SAFT military LiSO2 battery packs are available from:

Fair Radio Sales
http://www.fairradio.com/
Search on BA-5598

See http://store.batteryspecialists.com/ba5598u.html for more information. Note that current price
for new packs is $114.

I have used several packs from Fair Radio Sales (for which I paid ~$4/ea in quantity) with no
problems. They can be used as-is or plastic cases can be cut open to remove five 8AH cells.

Paul Verhage, KD4STH, discusses these and other battery choices in Chapter-4 of his ARHAB NearSpace
e-book available via http://www.parallax.com/dl/docs/cusapps/NearSpace4.pdf.

>>> Mike Manes <manes@...> 3/21/2007 12:58:42 am >>>
Hi David,

GL on your first flight! Sounds as though you have the right set
of beacons, but what freqs will they be on?

LiSO2 primary cells have proven to operate quite well in balloon
payloads. They have excellent energy density and low-temperature
tolerance compared to other chemistries. You can buy them new as
CR123 Li camera batteries, or more bang for the buck as surplus
BA-5513/U batteries - the individual cells operate at about 2.7
at 500 mA load, and can be trusted to give you at least 4000 mAh. Not
bad for 85 gm per cell and US$2 per cell. A camera store in NYC
sells them, but can't recall the name - try Googling BA-5513/U.

I assume that you have a parachute for your descent? A 1.8m diameter
conical should be about right for that payload. If you want to get
the payloads back, recommend deploying a recovery team around the
landing site as predicted by WinBallTrack, downloadable from
www.eoss.org.

Hi Mike, thank you for the info on the parachute. it was very informative. I knew nothing about the vent hole at the apex adding stability. Yes the hoop is certainly a virtue that would ensure it deplores immediately.
Thanks again, and it is info like this that will make the first launch a winner.

cheers david ve3bbn

Subject: Re: [GPSL] Parachutes, etc

Hi David,

Our 'chutes are made from ripstop nylon - not sure of the denier. A
2m diameter 'chute should weigh no more than about 500 grams, tho.
And be sure that there's a generous vent at the apex: 10-15 cm diameter
should do it OK. This helps prevent instability at high altitude.
Use dayglow orange material which enhances visibility during descent
and on the ground. Some of our 'chutes have alternating orange and
white gores.

The apex MUST have some means of attaching the balloon lift line as
well, and that should be plenty strong.

And be sure to fit a spreader ring about halfway up the shroud lines
to ensure proper 'chute opening. Ours use 7 mm diameter wicker, but
any lightweight flexible material will do. A hula hoop is suitable
for larger 'chutes - or maybe you could use a cut-down hoop?

You can probably find a suitable ready-made parachute from model
rocket suppliers. Spherachute (sic?) here in Colorado has made
several for EOSS. You may have to add or enlarge the vent and
add a spreader ring, tho.

Hi David,

If it's any consolation, the US Nat'l Wx Service launches
120 radiosondes (RAOB) from some 60 sites, usually near
airports, every day. And so far as I know, there's never been
a midair collision with a RAOB since I got into this game
16 years ago. Way back when balloon payloads carried long,
trailing wire antennae, there may have been a "barrage balloon"
effect with one or more aircraft, which explains the FAR-101
archaic requirement to flag such wires.

Your best guarantee to avoid a midair is to let the air
traffic folks know where you're at. After all, they are
really the only ones who can prevent a midair - you're helpless
even if you saw an impending collision, but the controllers
can steer aircraft around you, typically by 5 miles.

Thanks mike really great advise.
All of this info is going into a paper to present to the club to excite some interest. Normally it takes a couple of sticks of TNT, but these e-mails sure have spawned a real interest in me.

Subject: [GPSL] Plans for 20th anniversary ARHAB celebration in Findlay Ohio

I've starting to work out the details for the 20th anniversary of my first flight....I am currently planning on holding it the morning of Saturday, August 11th, 2007 from a farm near Findlay, Ohio...probably the same location as my first flight at WA8HDX's QTH.

I would like to invite any balloon group to come fly at this event ala a GPSL-style multiple launch and recovery.

I'm just in the planning stages of the event now and would like a quick show of hands of those who are thinking of attending or flying that day. I can do a group purchase of helium to make it as reasonable as possible.

That part of Ohio is ideal for flight and recovery...mostly perfectly flat farmground with few trees.

I'll announce more details as we get nearer to the date on my website:

I've forgotten, and the radio club has all of the paperwork. I can try
to find out.

The coverage is a general liability policy for the club and its
associated activities. As I recall (from ?six? years ago), the policy
included any liability that the club's property might induce on someone
or something. That supposedly includes an antenna tower, or a balloon
payload.

Hi Dave, sorry for the delay in answering some of your questions.
I have been considering a different type of drop off mechanism.
Though it may not work in the temperatures your talking about I'll
just explain it any way. I was thinking if a sqibb interlaced in the
nylon rope ,covered with styrofoam. The signal from the ground would
be 5 pulses one second apart and all the available battery voltage
would be employed in burning through it. at this same time the
recovery Tx would be turned on for the guys on the ground to start
moving. A small sulfur charge wrapped around the squibb would add fuel
for the burn through ?? what do you think ??

cheers David ve3bbn

From: Harry M
Topic: 2983 Message: 3023

If you are going to use a pyro squib you will have to use something that has its own oxidizer. There is no O2 at altitude. I used a black powder squib twice with good results. The draw backs are, I had to use a new one everytime, if it fails for some reason and fires on the ground, you could cause a grass/forest or building fire and making and/or handling pyrotechnics can be very hazardous to your health and maybe illegal depending on your laws. I am now using a nichrome wire burner that is contained with no heat or fire emitted to the outside. It is a whole lot safer and is reusable.

3024. GPSL 2007: Calling all presenters!

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-23 01:33:49 UTC
From: Roger Hammond
Topic: 3024 Message: 3024

I'm now taking volunteers and requests for sessions at the 2007 GPSL in

Grand Island, NE. If you are interested in presenting, please include the following in your response:

1. Topic (5 words or less)

2. Short description of your presentation (2 sentences or more)

3. How much time do you expect the presentation and related questions to take?

4. Do you have a preference of when you present?

5. What resources will you need for your program (projector, computer, DVD, tables, etc)?

6. A cell phone number for the presenter for questions or coordination.

If you are not interested in presenting, but would like to see someone else speak on a specific topic, I'd be interested in hearing your suggestions.

=========

It's $250 a pop for a balloon on the loose

CONCORD – People will want to hold onto their balloons if the Senate agrees with a House vote yesterday to ban balloon releases.

By a vote of 215 to 111, the House approved a bill that treats balloon releases as a form of littering.

HB 62 originally barred the release of two dozen or more lighter-than-air balloons.

The version that passed yesterday could bring a $250 fine for even a single balloon let loose. A second offense could bring a $500 fine. The bill specifically exempts hot air balloons, weather balloons and others released as part of scientific research.

The bill does not penalize accidental releases.

Those who favored the bill said the balloon materials, including the attached strings and ribbons, pose a serious threat to wildlife. Whales, turtles and seabirds that live along New Hampshire's coastline mistakenly eat floating balloons thinking they are food, and then are unable to eat real food.

"Do we now get balloon police?" Rep. Randolph Holden, R-Goffstown, asked.

Rep. Kevin Waterhouse, R-Windham, said police officers would be given enforcement responsibility.

A move to give the job to Fish and Game officers was rejected, since the department is under budget pressure already.

He said people need to be aware that balloon releases cause real harm to wildlife.

"It doesn't just go to heaven and disappear. It comes back down again," Waterhouse said.

Waterhouse said he was inspired to sponsor the bill by a group of homeschoolers studying ecology.

Hi Ralph,

Hey, thanks for bird-dogging that report! Great info, and it does kind
of confirm the level of risk that we undertake in ARHAB, especially
considering that NWS launches from their RAOB sites at 00Z and 12Z daily,
regardless of the trajectory, and with no notice to the FAA other than
launches within 5 NM of an airport. I think most of us are a whole
lot more forthcoming than that with the FAA. On the downside, ARHAB
payloads are generally a lot heavier than RAOBs, tho.

I'm curious about the livestock injuries. I'm guessing that those
resulted from a free-falling RAOB after a parachute failure. We've
had some pretty rapid descents when the 'chute got fouled during
PBC, but I think that issue is pretty well put to bed now with the
6 successive operations of the fast release device.

3028. Re: [GPSL] GPSL 2007: Calling all presenters!

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-23 13:18:21 UTC
From: PAUL VERHAGE
Topic: 3024 Message: 3028

Roger, here's what I'm planning.

1. Topic (5 words or less)
PongSat Flight Computer

2. Short description of your presentation (2 sentences or more)
Cramming a flight computer inside a ping pong ball and still getting
enough data from it to make it worth while.

3. How much time do you expect the presentation and related questions
to
take?
No more than 30 minutes.

4. Do you have a preference of when you present?
No preference of when

5. What resources will you need for your program (projector, computer,
DVD,
tables, etc)?
Projector and laptop. I'll bring the presentation on a jump drive.
I'll have items to pass around for show.

6. A cell phone number for the presenter for questions or
coordination.
(208) 631-7162

If you are not interested in presenting, but would like to see someone
else
speak on a specific topic, I'd be interested in hearing your
suggestions.

I can envision a couple of problems. The first is getting the
fire started, and the second is getting the fire extinguished.

There's almost no Oxygen at altitude, so any pyrotechnic device
will have to contain it's own oxidizer (as one of the other guys
has already pointed out). One such material is gun-powder. However,
note that black gun powder has a nasty tendency, under certain
conditions, to explode rather than combust. And, you really don't
want an explosion, either at altitude or on the ground. Also, note
that black gun powder is shock sensitive, and static sensitive.
It's pretty awful stuff, and demands the utmost in respect and care
at all times.

Smokeless gun powder doesn't have most of these problems, although
it may be a little harder to ignite. However, you still have to
come up with a way to contain it (since it is a powder) that doesn't
form a pipe bomb if something goes wrong [1]!

[1] I've personally burned a quarter pound pile of smokeless powder
with no problems; it just sits there and flames rather vigoursly
(but, make sure it's unconfined!) [2]. I wouldn't even think of
trying to burn an ounce of black powder, due to the explosion
possibility.

[2] This is, by no means, an endorsement of anyone trying this
themselves, especially without appropriate safety equipment and
training!

You might have better success with something such as a model rocket
engine, although finding one with a short enough burn time and
Isp may be a trick (since you don't really want to be flying the
payload around too much).

In any case, you'll need to worry about how to put the fire out, once ignited, since a flaming payload wouldn't be anyone's idea of fun! Sytrofoam is notorious for melting/burning in a manner somewhat similar to napalm! You'd almost certainly have to pack the pyrotechnic device in fiber glass, or some other non flammable material (and, consider where the hot gases will go, too, since they may ignite something).

I've seen (but don't have any personal experience with) what appears to be a better device. That device consists of a small metal film resistor which has the Nylon support line wrapped around it. To operate it, it's connected across the battery, and immediately overheats, softening/melting the Nylon support line, which results in it breaking. That might be a LOT safer than having an actual flame. Plus, there's not nearly the safety concerns about having an armed pyrotechnic device laying on the ground (due to it failing to fire when commanded), and what happens when the local population attempts to cut the package open (to see if it contains any beer).

Pyro and Ballooning

Just a few comments so you don't think my previous comments come from a backyard pyro. I was a Firefighter for 27 years. Outside my Firefighter job I have professional training and 15 years experience in the developement and use of black powder & composite rocket motors and formularies for explosives and pyrotechnics, ATF Class A,B,C,D. Unless you have professional training and experience I do not recommend experimenting with pyro at all. It's just not worth the risk!

Hi David,

I typically use the plastic embroidery hoops from the craft section at Walmart as a shroudline seperater....they come in two concentric rings, one goes over and one goes under the shroud lines and then are tightened with a thumbwheel screws and taped in place....they do make a difference...and are pretty cheap...and come in a variety of colors.

You stole my way dude!

just kidding,, except i just use one of the hoops and I epoxie the lines
with one turn around it.

Hi Joe,

Great minds think alike...particularly when they share the same birthday
LOL.

Roger,

My presentation title:

Long Duration Flight Techniques - to include HF telemetry methods for long distance telemetry.

25 to 30 minutes.....computer with DVD with projector.

If time allows...I could also present another topic:....20 years of ARHAB history.

3039. Cutdown mechanisms

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-24 00:41:33 UTC
From: wb8elk@aol.com
Topic: 3039 Message: 3039

Hi David,

I agree with the consensus of avoiding pyrotechnical devices for cutdowns....although they may work well in the troposphere, you'll find that they may prove to be a reliability problem in the near vacuum of the stratosphere....also, the fire hazard on the ground could be a problem.

Contact Mike Manes W5VSI for details on his unique mechanical release mechanism which operates automatically right at the point of balloon burst which prevents PBC (post burst chaos) which can tangle up parachutes with the remnants of balloon material....I believe the info is on the _www.eoss.org_ (http://www.eoss.org) website.

If you want to cutdown before balloon burst, then:

We've flown with quite a bit of success:

Nichrome wire wrapped around the flight string.....activated by a MOSFET attached to a 318 MHz garage opener style receiver and attached in a small lightweight box just above the parachute....the transmitter was on the main payload and also was a garage opener style unit turned on by an uplinked touchtone command....it's only activated for about 8 seconds each time the uplink command is sent to prevent overheating problems inside the cutdown payload.

Another method is the Buzz-O-Matic...a servo operated linkage that releases the flight string when activated....it can be mounted on the main payload....the beauty of this design is that the servo has very little stress on it.....Gary Dion N4TXI has the design here: _http://www.garydion.com_ (http://www.garydion.com)

Also, the latest technique that's being used at the UAH Balloonsat class is to take an archer's bow release mechanism and have a servo trip the trigger on it......you can buy the bow releases at Walmart for around 10 to 15 bucks or so.

From: Mark Conner
Topic: 3034 Message: 3040

I got started with wire wreath rings due to a concern for the brittleness of the plastic hoops at altitude. However, after about six years of use some of the welds (if you can call them that) have popped and I probably should replace them.

I believe Paul KD4STH uses wooden ones.

Hi David,

A 1 or 2 ohm length of #28 or #30 AWG NiCr (nichrome) wire, as often found in hair dryers, wrapped tightly around the nylon lift line and insulated by 1+ cm of styrofoam is effective. Just hit it with the full output of a 2x or 3x series of CR123 LiSO2 cells for 10 sec; the line will melt and separate under tension in about 4 sec. Tension is required, though, and 4 sec is time enough for burst latex shards to tangle in your 'chute shroud lines from time to time. The CR123's are good for about 10 shots, and rigging a new line into the burner takes about 15 tedious minutes.

EOSS has been using a mechanical fast release for over a year with excellent results. There a pix on www.eoss.org/about/ and hardware. Latest version is armed at about 70K' by a surplus RAOB anaeroid cell and weighs in at 168 gm complete with commandable backup release. Re-rigging takes about 2 sec once a new ring is tied onto the lift line.

Hi Harry,

FYI, EOSS refused to fly a student payload that planned to fire off
four Estes D engines at altitude because of the risk of igniting a
grass fire if the ignition controller messed up. That was a couple
of summers ago, when our Gov declared "Colorado's on fire!".

The NiCr burners can get orange hot, so it's a good idea to enclose
'em in an insulating housing with a fire-resistant cover - we use
Al duct tape over styrofoam. We did encounter an accidental burn
during prelaunch some time ago, and all that came out was a plume
of smoke.

We here have never seemed to have this tangle problem. I'm thinking of two possible reasons.

We have always used an oversized shroud ring. as has been discussed before, like a 18 to 24 inch diameter one. the shroud lines are practically parallel to the chute itself. This i honestly don't think is the cure. But,,

We have always had a very LONG line between the chute top and the balloon itself. This we have done not in thought of the tangle problem (since we never even thought of it, since it's never happened to us) But we've always done it for the stability of total flight train . you know to minimize the swinging side to side motion. the length maybe has ever been at the shortest of 20 feet or so.. and has been as long as close to 100 feet. But this was done to slow the pendulum effect. but it may have kept the latex shards away too.

Plus it's made recovery much simpler too if a payload is stuck in a tree, 90% of the time the end with the leftover of the balloon is reachable and it's simply pulled down!

Hi David,

Since Payload's 'R Us still hasn't gone international, no wonder you
have to homebrew 'em :=P (fact is, ARHAB and the shorter microwaves
are about the only remaining homebrew driven aspect of ham radio).

Since I still have dialup i'net service, pack the pix down as 25%
jpegs and the email under 1 meg. Or maybe you have a web site
where you could post 'em for all this reflector to peek at?

Topic: 2983 Message: 3051

Hi Mike, I'll try to get them down as much as I can. I hbrew everything I use, I think I'm just hung up on building hi hi .
I have just finished a Spectrum analyzer for 0 to 30 mhz. the display is fantastic.
Can even see the beacons down below 500khz. I am basically a HF builder and operator mostly on 80m. My Tx is built with 7 metal tubes and the amplifier is an 813. The Rx covers 3 chassis has a 50 ft bandspread for only 250 khz and a bandpass of only 80 hz, no xtals only tuned circuits with 1pf coupling (very hi Q), and has 42 metal tubes in it.
Enough of this old stuff, hi hi.

cheers David ve3bbn

Hi David,

Since Payload's 'R Us still hasn't gone international, no wonder you have to homebrew 'em :=P (fact is, ARHAB and the shorter microwaves are about the only remaining homebrew driven aspect of ham radio).

Since I still have dialup i'net service, pack the pix down as 25% jpegs and the email under 1 meg. Or maybe you have a web site where you could post 'em for all this reflector to peek at?

3052. GPSL 2007 presenters

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-30 02:27:54 UTC
From: Roger Hammond
Topic: 3052 Message: 3052

Here's what I have so far:

==========
Reach For Space Sometimes The Fox Wins
NearSys PongSat Flight Computer
Bill Brown Long Duration Flight Techniques
& possibly 20 Years of ARHAB History
Taylor University HALO Network
==========

If anyone else has a presentation they would like to give, please forward me the details.

Some additional information that hasn't reached the www.superlaunch.org website:

Thursday evening meal will likely be at El Tapatio at 6:30 PM for those getting into town early enough.
Friday evening meal at Valentinos at 6:00 PM, Valentinos is casual Italian. They do a pizza and pasta buffet, with a salad bar, taco bar, dessert bar, etc.

I'm still figuring out what to do for Saturday's lunch and dinner.

Hi Roger,

The Research Channel ran a 30-minute production on the Univ of Ky
Big Blue inflatable wing Mars glider project that EOSS has been
supporting for several years. I Tivo'ed it and could bring out
a VHS tape to play, if you're looking for conference slots to fill.

3055. KC8UCH balloon still flying over Lake Erie north of Norwalk, Ohio

Yahoo group: GPSL (2002 — 2008)
Date: 2007-03-31 02:11:05 UTC
From: wb8elk@aol.com
Topic: 3055 Message: 3055

My best guess is that it's over Lake Erie just north of Norwalk, OH on it's way slowly to Cleveland and parts east-southeast.

If anyone can rustle up someone in the Cleveland area to listen on 445.975 MHz FM, that'd be great....or on towards western PA....it will quite possibly stay up all night and into the next day. It is transmitting about 15 milliwatts from a BigRedBee board....no GPS...just voltage telemetry in audio CW.

It is still being heard by KA8LWR in Bucyrus, Ohio as of 10:08 pm EDT at a 10 degree bearing from his QTH.

Mike,

Please plan on bringing the Big Blue video. If nothing else, I'd like to get
a copy of it to watch for myself.
Is there a chance someone in your group could convert it over to DVD? If
not, we can make the VHS work.
It looks like there will probably be a slot for it in the program.

Joe Lynch, N6CL

Mark Ford <markus@...> wrote:
Greetings,

We're getting ready to conduct our first launch on or about Sunday, April 22nd from Bethel, ME. I would like to be able to predict the balloon's track and estimated landing location. What are people using for software?

I've tinkered with Balloon Track from EOSS (still trying to figure out how to get a prediction out of it) and the On-Line Near Space Flight Track Prediction Utility from Near Space Ventures. We'll be using UI-View32, so it would be great to generate an overlay for that.

If anyone has built a prediction utility in MS Access, that would be really cool.

Thanks,
-- Mark

Eric --

I stumbled on your very interesting high altitude balloon experiment web pages. There are several
Amateur Radio High Altitude Ballooning groups (ARHAB) across the US (and Canada and Europe). Most
groups have extensive web pages for which you will find many links via
http://showcase.netins.net/web/wallio/ARHABlinks.htm. The closest active groups are TVNSP centered
on Boise ID and Northwest Nazarene University also in Idaho. Flights have also been launched from
Fire in the Sky, http://www.fireinthesky.org/.

You are welcome to submit ARHAB Launch Announcements which would be posted to
http://showcase.netins.net/web/wallio/ARHABlaunchannouncements.htm.

You are welcome to submit ARHAB Record entries. See
http://showcase.netins.net/web/wallio/ARHABrecords.htm for our numerous categories.

Collectively there are ~115 ARHAB flights annually.

More discussion if/when it will help.

http://spaceweather.com/

STRATOSPHERIC PHOTOGRAPHY: Consider it a test flight. Swedish University students Jörgen Hedin and Michael Erneland wondered what it would be like to send an ordinary digital camera into the stratosphere and take a picture of the scenery. So on March 28th they launched a weather balloon with a Samsung DigiMax Pro 815 onboard, and here is the result:

"This photo was taken about two and a half hours into the flight at an altitude of 25 km," says Hedin. "The balloon was straight above the city of Rovaniemi in Finland and the camera was pointing east. In the high resolution image one can see the Swedish/Norwegian mountains in the distance."

At an altitude of 25 km, the balloon was above 95% of Earth's atmosphere. The air was only a few percent as dense as air at sea level, and the temperature was about 55 degrees C below zero. These are conditions typical of the planet Mars! How appropriate that the black of space is visible just over the horizon.

The test flight was a big success and more flights are planned. Stay tuned for photos of meteors, auroras, stars and planets--the possibilities are stratospheric.

3068. Superlaunch website correction

Yahoo group: GPSL (2002 — 2008)
Date: 2007-04-17 02:22:24 UTC
From: Roger Hammond
Topic: 3068 Message: 3068

It was brought to my attention that there is an error on the
www.superlaunch.org website for GPSL 2007 here in Grand Island, NE.
In the Getting to Grand Island section it reads:

Grand Island is home to the Central Nebraska Regional Airport (GRI). There
are a few air carrier flights daily on commuter size aircraft. Lincoln (LNK)
is about an hour west of Grand Island on I-80, while Omaha (OMA) is about
2.5 hours west of Grand Island on I-80. Both Lincoln and Omaha have
regularly scheduled flights on several of the airlines.

The references to Omaha and Lincoln being west of Grand Island are
incorrect. They are both EAST of Grand Island. I mistakenly passed along the
incorrect information to Zack, who is keeping the website updated for me.

If any of you new GPSL list members are considering attending this year's
conference and launch, and have any questions regarding the event please
don't hesitate to email on or off this list.

Sorry about the error.

Thanks,

Roger KCØMWM

Hi Mike,

An interview of Jean Laby can be found on this website. A copy of a paper she wrote on this technique of floating a rubber balloon may still be in my old lab in Laramie - I suppose I need to phone to see what has been (will be) done with all that stuff.

She used a ping-pong ball, as I remember, and maybe there was a small spring to keep it seated. A cage around the ball/seat assembly kept the string from getting tangled (it was loosely coiled around the outside of the cage prior to launch). The neck of the balloon has to be modified, likely mostly cut away and then glued/tied around the valve assembly.

Hi Luis,

Well done, sir!

She was quite the pioneer in ballooning as well in high altitude
physics. Norm was fortunate to have met her at her home some time
ago.

Hi Art,

You might also consider getting on the GPSL reflector, which has
sort of become the ad hoc prop-head balloonatic reflector recently.
I've taken the liberty of cc'ing it.

I wrote an article entitled "New Heights for Amateur Radio" for the May issue (page 12) of Monitoring Times magazine which just hit the magazine racks at my local bookstore. The May issue is their annual ham radio oriented issue. There is also a good article on 10 meter propagation beacons.

This came about when my HiBall-10 flight landed just a mile away from the magazine's headquarters and near the publisher's home (Bob Grove W8JHD of Grove Enterprises in Brasstown, NC) who took part in the hunt.

It's time to start thinking about your flight train for GPSL 2007. If you or your group intends to fly this year, please provide me with the following:

(Note: Even if you're not sure of all the parameters at this point but do intend to fly, please let me know so that I can assign time slots and anticipate the gas requirements.)

1. Name of your group
2. Website for your group
3. Callsign(s) of your payload
4. A cell phone number that will be carried on the chase (for post-recovery coordination)
5. Number of transmitters and their band (specific frequencies only if you're
rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq).
6. Size of balloon
7. Approx number of helium tanks required (K or T)
8. Total flight weight
9. Expected ascent/descent rate
10. Projected burst altitude
11. Special requirements/requests for the GPSL coordinator
12. Short description of your payload including cameras, transmission modes, experiments, etc.

73,

3081. Introducing New York Near Space Research (NYNSR)

Yahoo group: GPSL (2002 — 2008)
Date: 2007-04-29 12:49:45 UTC
From: javier_ndrsn
Topic: 3081 Message: 3081

The Irvington High School Science Club is announcing the creation of a New High Altitude Balloon group. The group will be called "New York Near Space Research" or NYNSR for short and will be conducting flights by late Spring next year in the Lower Hudson Valley. We are hoping to have a website purchased by the end of this weekend and have some more information available. We have started a public Google group under the name New York Near Space Research already and you may join if you like.

73 to all,
Javier Anderson, KC2MFC

Here's the data for the EOSS flight at GPSL.

73,

Nick
N?LP

1. Name of your group Edge of Space Sciences (EOSS)
2. Website for your group www.eoss.org
3. Callsign(s) of your payload AEOSS-11
4. A cell phone number that will be carried on the chase (for post-recovery coordination) 303-601-5369, Mike Morgan, N0MPM
5. Number of transmitters and their band (specific frequencies only if > you're rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq): Three, two on 2 meters and one (ATV) on 70 cm.
6. Size of balloon: 1200g
7. Approx number of helium tanks required (K or T): Full T or 1.5 K. (Nice to have a spare or two)
8. Total flight weight: 9.5 lb.
9. Expected ascent/descent rate 1200-1500 ft/min
10. Projected burst altitude 95,000 ft.
11. Special requirements/requests for the GPSL coordinator: None at this time.
12. Short description of your payload including cameras, transmission modes, experiments, etc.: Real-time ATV with position overlay fed by Zigbee B-Lan from GPS, temperature & barometric altimeter data in downlink telemetry, APRS for tracking, cutaway/beacon for track & recovery

Hi Javier,

Welcome to the Balloonacy World! We look forward to hearing of
some outstanding success with your first flight.

Towards that end, I'd recommend that you join the balloon_sked
yahoo group. That will get your flight announcements out on
Ralph Wallio's quite thorough announcement list.

If you need some tips or help getting your first payload up and
back home, here's the place to ask. You're also welcome to browse
the EOSS site, www.eoss.org, for stuff gleaned over 16 years and
117 flights and recoveries.

Hi, Javier. This is from the MECSAT balloon group in New York.
Although we're based in Brooklyn, our flights are at our base in
Paradox, NY. Since last year, we've been flying both BalloonSATS and
ozonesondes. We also have high school students from both NY and
Vermont involved in our flights now and have an upcoming flight in
Paradox (May 7) with our students and high school students from
southern Vermont. We're flying all summer and you're welcome to join us.

3088. Boulder Conference

Yahoo group: GPSL (2002 — 2008)
Date: 2007-04-30 20:49:33 UTC
From: PAUL VERHAGE
Topic: 3088 Message: 3088

Mike, Bill, and I attended the LCANS conference last week.

One thing I got from LCANS is the concern over work force development. We're not graduating enough engineers and near space is looked at as one way to develop the work force. A lot of our experiments are looked at as toy science. So we need to sell our amateur programs as a means to get students interested in math, science, and engineering rather than doing real science.

The university space grants now have to account for every dollar they spend and how many people that money reaches. We'll get bigger exposure if we can may our launches web based or get a lot of students involved. If our launches can reach a lot of students, we can apply for space grant funding. If they don't reach a lot, we'll have to look for funding from other sources. I'd like to look at grants for small amounts of money, places like Target or Walmart that have helped schools before.

There's a pent up demand for launches that are tens to hundreds of pounds. NASA's balloon office (CSBF) is filling the need for the big heavy stuff (observatory class missions) but nothing is really doing the smaller stuff. One solution is for multiple experiments to share a balloon lift. But that's not something we can help with. Where I think ARHAB could help out with testing individuals sensors or circuits, rather than entire payloads. That may be of interest to researchers if we let them know we can launch a test for them. It's not that we'd be certifying an experiment, rather that we'd be showing that the sensor is worth pursuing in bigger payloads because it produced something useful on one of our flights.

So anyhow, those are my thoughts.

Paul

3090. Looking for contacts in KS, west TX, OK, MO or IL for Arbonet balloon record

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-05 01:48:01 UTC
From: wb8elk@aol.com
Topic: 3090 Message: 3090

I'll be attempting a EBE record 2 way contact through the crossband repeater on the Arbonet balloon Saturday morning from NE Texas....I'm just south of Huntsville, AL at grid square EM64oj on Wilson Mountain with a very good shot at it from 420 miles out. The potential exists to get close to a contact of 800 miles distance...any takers out in middle and western TX, OK, KS, MO or IL? Wichita, Salina, Kansas City are all in range. There may also be a station 80 miles closer from western AL (KU4WW) on the air as well who will most likely be in range a lot longer than I will be.

445.80 uplink....147.56 down

K5FRC-11 on APRS

7.260 HF net

details at _http://www.arhab.org_ (http://www.arhab.org)

3094. GPSL flight coordination for NSTAR

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-05 17:45:36 UTC
From: Mark Conner
Topic: 3094 Message: 3094

1. Name of your group
Nebraska Stratospheric Amateur Radio (NSTAR)

2. Website for your group
www.nstar.org

3. Callsign(s) of your payload
N9XTN-11 (pri) N9XTN-12 (alt)

4. A cell phone number that will be carried on the chase (for post-recovery coordination)
402-201-4422

5. Number of transmitters and their band (specific frequencies only if you're
rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq).
2 APRS trackers (2m VFO)
SSTV (2m, prefer 147.585 MHz) or simplex repeater (70cm, prefer 446.300)

6. Size of balloon
1200g or 1500g (possibly 3000g if conditions are excellent)

7. Approx number of helium tanks required (K or T)
1 T if 1200g or 1500g, 1 1/3 T if 3000g

8. Total flight weight
Approx 10 lbs

9. Expected ascent/descent rate
1000/1000 ft/min

10. Projected burst altitude
90kft if 1200/1500, 107kft if 3000g

11. Special requirements/requests for the GPSL coordinator
none at this time

12. Short description of your payload including cameras, transmission modes, experiments, etc.
Digital camera
SSTV, if used, will be Robot 36

3095. Re: DTMF servo control

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-06 02:44:27 UTC
From: Mike Manes
Topic: 3095 Message: 3095

Hi Don,

This is how we did it on one of our older ATV modules. But the round tuit needed to put it the new one has been evasive.

Suggest using a Basic Stamp I or II with a DTMF decoder driven by a 2m rcvr (or 70cm if you're not running 70cm ATV). The BSC's have PWM output commands, and most PWM-style R/C servos will lock to a new commanded position within about 10 cycles of a new PWM command; no need to drive the servo continuously. You could pack that code into the same BSC chip that you're using as an ATV audio channel IDer, and even mix the in the command receiver audio to make for a cross band repeater of sorts.

3096. Re: [Ballooning] multipath fading

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-06 03:05:44 UTC
From: Mike Manes
Topic: 3096 Message: 3096

Classic post-burst chaos. I think it's probably driven by parachute instablity, where the high-pressure bubble under the canopy tries to sneak out from under the skirt - and it does that asymmetrically, thus producing thrust that pushes the 'chute farther off vertical, thus causing more dumping and thrust, until the canopy is largely deflated. Then it moves back upwards to a near-vertical position, before starting a new cycle. A generous vent at the apex is very effective in attenuating PBC, but it's also important to get rid of the balloon shards hanging off the apex ASAP as well, since they almost guarantee an asymmetrical parachute. I did a pitch on this at last year's GPSL

I've not yet abandoned the question of localized high-Mach drag rise as a contributing factor. At the SWRI LACANS conference, Tim Lachenmeir of Near Space Corp (formerly GSSL) stated that he's observed trans-sonic airspeeds during pullout of glider dropped from 100K'.

3097. share flight expenses X 2

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-06 16:27:33 UTC
From: Roger Hammond
Topic: 3097 Message: 3097

Are there any groups attending GPSL 2007 that have the extra capacity for a 3 - 5 pound payload?
We have a new group in Nebraska, BUNS headed up by Brek Brixius, that will be flying for the first time with an unproven APRS tracker that is willing to share expenses with anyone that has the capacity for a 3 - 5 lb payload.
Also, Zack WØZC from Traveler is trying to squeeze GPSL into his busy schedule and may have a new payload weighing in around 3 - 4 lb that he'd like to try out and also "hitch a ride" with someone.

If someone has the payload space available, let us know.

Rog KCØMWM

3098. Re: [GPSL] share flight expenses X 2

Topic: 3097 Message: 3098

Hi Rog,

EOSS is up to 9.5 lb of payload right now - only 2.5 lb spare under the
12 lb Part 101 exempt limit. We can share unused Helium if another
group needs it for a heavier load, and we don't need it for our spare.

3101. Re: FAA issues?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-09 21:45:06 UTC
From: Mike Manes
Topic: 3101 Message: 3101

Hi Don,

The FAA proposed some new regs re Unmanned Air Devices in civil aispace as an NPRM - published Feb 6 in the Fed Register as Docket FAA-226-25714. You can see the NPRM and comments submitted by ALPA and EOSS by browsing under dms.dot.gov and looking for that docket number. Unfortunately, the comment period expired a few days ago, so all we can do keep fingers crossed.

EOSS had 2 issues with the NPRM:

1. Its scope was broad enough to encompass all Part 101 devices. From some follow-up emails, it's kinda clear that the folks at UAPO who published the NPRM that they were not aware of unmanned balloons, how they operate or what they do. It seems that all they were thinking of was DoD "Predator" and "Global Hawk" birds, although they did acknowledge development of smaller unmanned aircraft - all powered and ground-launched, however.

2. It also placed unreasonable restrictions on emerging development of steerable balloon descent devices, like sport parachutes, etc.

The EOSS comments requested an explicit exemption of 14 CFR 101 devices and reasonable accomadation of slow, light unpowered steerable unmanned balloon payload descent devices.

Thanks for your interest, and I wish I'd got wind of this NPRM earlier so more ARHAB folks could have commented.

3109. FAA NPRM re UAS

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-11 00:45:54 UTC
From: Mike Manes
Topic: 3093 Message: 3109

Hi Joe,

I've not heard about when and how these new regs will be published.

The FCC's NPRMs typically go into effect immediately after the 90-day comment period ends. But those dox are written a lot more formally than the the one on UAS. So I don't know for sure. However, our experience and that of Space Data Corp and NSC is that the FAA has been treating steerable unmanned balloon payload descent devices as UAVs, so unless the EOSS comments get favorable consideration, the question is moot for now.

Keep your fingers crossed.

3110. Re: FW: high altitude balloon payload science

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-11 04:38:21 UTC
From: Mike Manes
Topic: 3110 Message: 3110

Hi Rob,

Apologies for the eoss.org email not making it thru the system. My ISP has taken a passionate dislike of that URL, despite my efforts to "white list" its traffic. BTW, it wouldn't have made it to me anyway, since my username on eoss.org is w5vsi, not v5vsi.

But rest assured that my primary address works fine:

manes@...

Now on to your question:

A scientific payload that light should have no problem hitching a ride on any number of EOSS's "heavies" - however, since we don't have an FAA-qualified strobe light per 14 CFR 101, we don't fly at night. And your payload should be prepared to withstand some extremely cold ambient temperatures at night, absent the sun's IR flux.

Nor should it present a problem for one of our peer balloon groups who operate much closer to Dartmouth. So I've taken the liberty of cc'ing a couple of reflectors that many of them receive.

Few fly at night, but there are a few who are working on long-duration balloons, i.e., overnight flights. The downside is that those overnight flights also travel very far downwind, especially in the winter. During the spring and fall polar cyclone "turnaround", however, it's possible to attain a near-stationary position in the stratosphere. Those are tight windows and are difficult to predict with confidence, however.

Now, if you are willing to kiss your payload goodbye, then it may be possible to telemeter your photometry data in real time during the flight. I assume that your data bandwidth is no more than a few 10's of bps. This is also not a great challenge, since most balloon groups also telemeter their GPS data in flight.

I just read your attached paper on a station-keeping high-altitude airship, and your acknowledgment of SWRI's Bill Perry's collaborative work. It occurred to me that you would have enjoyed attending the 26-28 April 07 SWRI Low Cost Access to Near Space workshop in Boulder. There's an online "proceedings" from that conference at:

http://www.boulder.swri.edu/LCANS/LCANS_SpeakerList.html

Jerry Knoblach's presentation on Space Data's developments may be of particular interest. Jerry presents a persuasive economic argument for the use of a series of low-cost latex balloons in lieu of a station-keeping airship. Space Data has perfected valved latex balloons to keep near

space cell site coverage over a target area for several days. He may even entertain giving you a lift, since Space Data is also doing some DoD work.

Let's discuss your needs in more detail, perhaps even in person during our flight for Colorado Space Grant, HQ'ed at CU, set for 16 June out of our launch site in Deer Trail CO, about 50 mi E of Denver on I-70. Does that fit your travel plans?

Best regards,
Mike Manes W5VSI
Prez EOSS

I'll need a tank and a half for my balloon. So I'm ordering one tank and hoping to split the cost of a second tank.

Paul

Hi Brek,

"Things should be made as light as possible, but not more so"

So if your camera weighs just a few oz, then adding some LiSO2 batts for cold temp operation and a foamcore enclosure with some added foam insulation inside should keep you under 1 lb - and we can manage that easy.

All we ask is that you use the thru-tube line attach method so your enclosure doesn't have to carry the payload line tension. Make sure the tube ends are well de-burred!

You could also tie off to a couple of loops on our line, but that doesn't keep your payload axis aligned, and it's at greater risk of getting wiped off during parachute drag.

You could also test your cutdown by putting it on a short section of lift line that's shunted by another main thru line that's not cut.

And don't worry about weighing us down. The sooner the balloon bursts, the sooner we get to lunch!

Watch out for those "bargain" outdated balloons. It's no bargain if it blows after you've dumped $50 of He into it! It's happened.

And don't waste $$$ on a regulator. Nothing but trouble, since they tend to freeze up. Just get a 10 ft length of 1/2" reinforced rubber hose and use the tank valve to control the fill flow. Use a 8" length of PVC pipe for your 1200 gm fill tube, with a cemented PVC reducer to 1/2" NPT to mate the nipple on your fill hose. Use a hose clamp or 2 to hold the balloon neck tight on the filler tube. Some nylon line tied just above the PVC reducer provides a place to tie off your tare weight.

Hi Paul,

Roger says that his suppliers will take untapped bottles back for a
refund. So we ought to "pool" the attendees to drain as many bottles
as possible, leaving as many as possible untapped.

EOSS is ordering 2 T bottles, although we will need just 280 cuft if our
1200 gm fill goes uneventfully. You can have the remaining 20 cuft, gratis!!

Thanks Mike. I'll work on packaging a camera in some certafoam with a through tube. When I get that done I can mail it to you folks in advance so you can inspect it.

I already have a regulator and I made arrangements with a welding shop to fabricate the hose for it today. As for wasting money, I have and wish I hadn't but, I'm not sure how to avoid it. I guess it is the cost of education.

Asking questions helps. I sure feel like a dummy asking some of these things but, I have learned that I better ask. Thanks for the advice Mike and everybody.

In your note to Paul it looked to me like you expect 150 cu ft. per T -tank? I was thinking they were bigger than that. Maybe I need more gas. Also, I don't want to put up a light payload on a balloon that is underfilled and might not burst. Then if my cutdown fails, I'm stuck.

What I have read said that helium would lift approx. 1 oz per cubic foot at sea level. Is that what you figure?

Thanks
Brek - KC0YOE

Hi All,

I just started reading some of the info at the below web site. And, there is something strange,
It was talking about when they were testing a new film, and a "Click here" to see the balloons path. Which i did, at http://stratocat.com.ar/globos/mapas/map_568NT.gif
Thing is uhhhh,, the circle I have seen before,,,, But the perfect 90 deg left turn seems un real. I'm suspecting just bad tracking,, but at the same time find that hard to beleive that their tracking could be so much worse that any of us amateurs.

The track doesn't look too odd - I think the lazy circle on the left
was much tighter during the faster descent and ended up looking like a
90-degree turn. They may have had a few tracking glitches near I-40,
though.

See the relatively sharp turns during this flight:
http://www.nstar.org/KNSP/knsp98.html#98C

Hi Brek,

You don't have to send me your payload - not that tough to fix on the spot at GPSL if there are any issues.

And I know a T bottle holds about 300 cuft - I was referring to Paul's request for half a bottle.

Paul's book is a valuable resource, but it is limited to Paul's preferred techniques w/o ref to other group's ideas. EOSS has its own version of a handbook on the EOSS web site - it's pretty long in tooth and doesn't include a lot new stuff that we've developed since. But it does present an alternative view, particularly with respect to tracking and recovery methods.

We used to use a regulator - and it froze up on me at GPSL 2003 in KS humidity. So I just took it out of the line and used the tank valve - worked great, and we've used that method ever since. The regulator just protects against one hazard - a kinked fill hose that will burst under full tank pressure - so that's why I mentioned the use of a reinforced hose. Some folks use garden hose, and that's where a regulator is needed - but the economics don't pan out for the system.

From: Mike Manes
Topic: 3107 Message: 3118

Hi Joe,

I haven't visited that site, but at GPSL 03 or 04, there was a 90 deg wind shear at about 30K' that affected the trajectories of all 6 balloons that day. And one one of the "heavies" - an 8-hour ZP at 100K' in the summer - we tracked the balloon over a 200-mile long x 50-mile wide oval at altitude, and we cut it down when it returned to nearly the same point where it hit 100K'.

I'm sure that CBF gear is at least as good as the stuff we fly!

From: w1lwt
Topic: 3119 Message: 3119

when I did my cut down device testing I used a series 4 foot adivitiseng red, blue balloons with ornge mrking tape tails at 50 foot each with one emergency blanket on each as a trailer to be seen from a distance that i would watch with a spotting scope to see responce to my testing and radio contact back to the launch site to hook up the next one and pull safety pin to cutting device.on a 6 lb test line at 200 +- feet and at cutting device I used 38 lb test line for a measure of 2 foot in the middle with device i tested line responce and device distance cutting effect and I had One person at the field at the house to monitor it and each cut down i did in series of 3 and 5 miles then 10 than 20 and 25 and I would watch with a spotting scope each one was also vcr taped to veiw later . and a few times with a minuture security amera like you buy at walmart for 75.00 bucks and I had thos connected to below the cutting dive and on its own parachute so when i cutt it the camera recorded what i needded and the drop to the ground and the blloon would take of and i watch it to verify launch and time and on the letter package i had a return letter for finders out there. after a group of 12 test over a few week ends i found it was a good system for me to use i designed and use for launches. up to 25 miles line of sight and reliable. but mind you 99.99 % of my launches oour over the ocean and 2 out of 15 launches was found . the others are still floating out there. but I gave up about worring about recovery I enjoy the launches and tracking and information gathered for the next and shareing the projects with all HAMS in Maine on the NETs.

3120. If you are flying at GPSL 2007...Please read.

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-14 02:51:03 UTC
From: Roger Hammond
Topic: 3120 Message: 3120

This is a copy of an email I submitted about 3 weeks ago. If you are planning to fly at GPSL this year please send me as much information about the transmitters you will be flying as you can. I'm trying coordinate frequencies, time-slotting, and I-gates so that everyone's payload can be accommodated. If I missed you in the first round, I apologize but please send me your information again. Here are the groups I've heard from:

WB8ELK
EOSS
BUNS
NSTAR
ORB

1. Name of your group
2. Website for your group
3. Callsign(s) of your payload
4. A cell phone number that will be carried on the chase (for post-recovery coordination)
5. Number of transmitters and their band (specific frequencies only if you're rock-bound or don't wish to be time-slotted with others on the 144.34/39 freq).
6. Size of balloon
7. Approx number of helium tanks required (K or T)
8. Total flight weight
9. Expected ascent/descent rate
10. Projected burst altitude
11. Special requirements/requests for the GPSL coordinator
12. Short description of your payload including cameras, transmission modes, experiments, etc.

73,

Roger KCØMWM

3121. Re: [GPSL] Re: EOSS-120 / GPSL '07 Draqft payload plan

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-14 05:37:02 UTC
From: Brek Brixius
Topic: 3112 Message: 3121

OK Mike. I won't mail it. I did finish it though. It is a small foam cooler with a through tube, coroplast base pallette, the tube was sanded smooth. I am using 100lb braided dacron looped back on itself 2X (4 strands) and I glued the knots. If I throw in a log tag (temperature logger), the module loaded with camera and batteries weighs right at 1 pound.

I posted some pics to the group. Take a look and tell me if you see anything that needs changed.

One thing I noticed about the through tube, the module spins rather freely. My camera is prone to motion blur. When I fly a like camera from a kite, I have to use a picavet suspension. Is there a way to prevent rotation of a through tube module? Maybe glue the bottom knot to the tube?

Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Brek,

You don't have to send me your payload - not that tough to fix on the
spot at GPSL if there are any issues.

And I know a T bottle holds about 300 cuft - I was referring to Paul's
request for half a bottle.

Paul's book is a valuable resource, but it is limited to Paul's preferred
techniques w/o ref to other group's ideas. EOSS has its own version of
a handbook on the EOSS web site - it's pretty long in tooth and doesn't
include a lot new stuff that we've developed since. But it does present
an alternative view, particularly with respect to tracking and recovery
methods.

We used to use a regulator - and it froze up on me at GPSL 2003 in
KS humidity. So I just took it out of the line and used the tank
valve - worked great, and we've used that method ever since. The
regulator just protects against one hazard - a kinked fill hose that
will burst under full tank pressure - so that's why I mentioned the use
of a reinforced hose. Some folks use garden hose, and that's where
a regulator is needed - but the economics don't pan out for the system.

I'd be happy to split a tank. After talking to Roger, I see he plans to have a spare tank for this situation. Guess I better save my pennies.

Paul

>>> Mike Manes <manes@...> 5/11/2007 6:29 pm >>>
Hi Paul,

Roger says that his suppliers will take untapped bottles back for a
refund. So we ought to "pool" the attendees to drain as many bottles
as possible, leaving as many as possible untapped.

EOSS is ordering 2 T bottles, although we will need just 280 cuft if our
1200 gm fill goes uneventfully. You can have the remaining 20 cuft, gratis!!

Topic: 3123 Message: 3123

Hi Don,

Since you have a KPC-3+, you already have 2 analog telemetry ports (8-bit,
0 to +5V) available on the DB-25 pins 11 & 18. See the ANAlog writeup
in the command ref part of the KPC-3+ manual. We use the Nat Semi LM335
temperature sensor which yields an output of 10 mV/deg K; e.g., +2.73V appears
at 0 deg C (273 deg K). Note that the LM335 does dissipate a few mw, so
you must use a convective heat sink to get good coupling to the ambient
air - which is pretty thin at 10 mbar! Also shield the outside sensor and
sink from the sun and paint it flat white. Don't forget that the sensor
reads its OWN temp, not necessarily that of the medium it's embedded in.

Set up the TELEMetry command to determine how often the analog telemetry
gets beaconed.

Now, if you want the BS to send its own stuff, then you'll need to convert
the TTL levels to RS-232 levels and have the BS issue Unproto data to the
serial port (first go to Converse mode using <ctrl-C> K <cr>), and then
sending a line of telemetry in 7-bit ASCII followed by a <cr>. It will go
out as a beacon sent to your UNProto address and path.

Reply-To: Ballooning@yahoogroups.com
To: Ballooning@yahoogroups.com

Last week I posted this request on the National Space Society Chapter for Space Elevator group. I would like to expand to a larger audience , hence this post. Liftport's new vision and goal is an open source and highly collaborative organization adopting the Wikinomics paradigm. Not everyone agrees one on what that means,(or understands what that means) but that is not important for the work that needs to be done in the near future. There are two general areas were Michael needs lots of help:

A. Helping with LiftPort's high altitude balloon effort.
B. Building content on the LiftPort's Part of the Wikinomics site

I will receive specific to-do lists in the very near future. Mean time I would like to start organizing a list of volunteers who are interest in helping with these efforts. If you are interest in building content on the Wikinomics site, you should start looking through it. I have place links at the end of this message.

I believe this is an opportunity to really make a difference in making the elevator to space a step closer to reality, and certainly helping Michael and Liftport, so please spread the word.

I have an old balloon and was considering buying another old one as a backup. I might be interested in buying a new one though. Where is the best place to get a sigle balloon?

Also, I read in an old manual somewhere that if the Balloon was past date that it could be used but should be placed in boiling water first. Anybody ever heard of that?

Brek - KC0YOE

Boardwalk for $500? In 2007? Ha!

Kaymont Consolidated sells Totex balloons (www.kaymont.com), and Scientific Sales sells another brand that's not on our preferred vendor list. I think they sell onesies. Availability may be an issue, since we've had to wait a couple of months for shipment from Japan if Kaymont is out of stock.

I've not heard of boiling an old balloon, but Norm Kjome has soaked 'em in kerosene - in fact, that's how he made the 121.5K' record with an old 3000 gm and a 3 lb payload. BTW, old balloons have a pretty bad record of wasting a load of helium. Like putting used motor oil in a Ferrari; it pays off, for a while ...

My book on Parallax describes how to do this also.

If you're starting from scratch it's easier and cheaper to use a Tiny Trak.

Paul

>>> Mike Manes <manes@...> 5/14/2007 9:45:58 pm >>>
Hi Don,

Since you have a KPC-3+, you already have 2 analog telemetry ports (8-bit,
0 to +5V) available on the DB-25 pins 11 & 18. See the ANAlog writeup
in the command ref part of the KPC-3+ manual. We use the Nat Semi LM335
temperature sensor which yields an output of 10 mV/deg K; e.g., +2.73V appears
at 0 deg C (273 deg K). Note that the LM335 does dissipate a few mw, so
you must use a convective heat sink to get good coupling to the ambient
air - which is pretty thin at 10 mbar! Also shield the outside sensor and
sink from the sun and paint it flat white. Don't forget that the sensor
reads its OWN temp, not necessarily that of the medium it's embedded in.

Set up the TELEMetry command to determine how often the analog telemetry
gets beaconed.

Now, if you want the BS to send its own stuff, then you'll need to convert
the TTL levels to RS-232 levels and have the BS issue Unproto data to the
serial port (first go to Converse mode using <ctrl-C> K <cr>), and then
sending a line of telemetry in 7-bit ASCII followed by a <cr>. It will go
out as a beacon sent to your UNProto address and path.

I always purchase balloons from Kaymont (www.kaymont.com). I just got two 1200 gram balloons for $130 including the shipping.

I heard that Norm Kjome recommends soaking old balloons in kerosene before filling them. Perhaps EOSS can fill us in on this strange practice.

Found: Amateur / student latex balloon payload on beachfront of Radisson Suite Hotel (3101 North Highway A1A, Indialantic, FL) early morning (~7 am) on Sunday, May 6, 2007. Balloon payload appears to consist of (see attached images) one box construction of ?" foam board containing an upward looking video camera plus ATV antenna and transmitter, one box also constructed of ?" foam board containing a GPS received and telemetry transmitter, a clear plastic parachute, latex balloon remnant and flight string. No identity tags were found on the payload. Payload boxes and electronics were recovered by T. Gregory Guzik of Louisiana State University. If this payload is yours, please contact me at guzik@... and I will ship the component to you.

Cheers,

Greg Guzik

I would agree with Mark that it probably was fairly recently lost due to the duct tape still being intact and the Little Wheel ATV antenna doesn't look very corroded and probably splashed down at sea perhaps some distance away.....I would venture to guess it's someone along the Atlantic Seaboard and could've have drifted at sea for some distance....perhaps the Puerto Rico group. Although I've personally dropped 8 payloads into the Atlantic (got one back that landed next to a speedboat in Boston Harbor) and Gary Dion N4TXI also of Huntsville AL has dropped one or two out there in the Bermuda Triangle...none of them had ATV onboard.....Lee W1LWT in Maine did however drop a number of payloads at sea including ATV I believe...I'll email him to see if this one is his.

I would imagine that the tracker chip may still have the callsign embedded in it....and the make of the tracker could be a clue too....if it's a MIM chip...then it's been out to sea for awhile....might be a new entry for "longest recovery time"

The Tiny Trak is just a dumb APRS beacon, however, and doesn't support telemetry or digipeating. It's also kind of susceptible to counterpoise RF, requiring some Black Art from time to time to yield a clean packet signal. It is cheap and light, however. And although it can be time slotted, the slot timing re GPS is set just once on the first valid RMC or GGA sentence, and then drifts based on the PIC clock freq error - it can slip 10-15 sec over 3 hours.

From appearances, that's the more likely scenario. The gulf stream runs
N along the E coast of FL, so it might have been one of the U PR flights.
I'll forward the email with the pix to Oscar.

The gulf stream runs N along the Atlantic coast, so it'd be real weird
if was launched as far N as Maine. And brass does stand up pretty well
in sea water - that's why it's used on boats.

It may have landed in the Gulf of Mexico or Caribbean as well - the gulf
current starts there.

I forwarded Ralph's email to Oscar Rento KP4RF at U PR.

Paul...if it came from the Bermuda Triangle...then it may have come from the future and not been launched yet.

I heard from Hector N1TKK in Puerto Rico and Lee W1LWT in Maine and it's not one of theirs even though both groups have lost payloads in the Atlantic.

I did however, find out that there is a student program out of UCF that flies from the Cape and that's very close by....so it very likely may be one of theirs....I emailed one of their people to see.

Robert,

With the payload in reasonably good condition, I suspected that it could not have been in the water very long. Do you have any pictures of the launch? It would be interesting to compare the before and after shots. Send me an address where you want the components shipped and I will get it in the mail within the next few days.

Cheers,

Greg

It is ours. I work with the Florida Space Institute(FSI) under the University of Central Florida. FSI runs Florida Space Grant and I work with Space Grant also. Space Grant and Space Florida (a state entity) team up and hold "Florida Space Academies" for college, high school, and middle school students. It is usually 1 week of putting the payloads together and tours of KSC/ Cape Canaveral Air Station. The academies are designed to encourage students to stay in school and further their education in Florida and to stay in Florida working in the space industry(hopefully). The main players in the academies are: Mr. Tony Gannon, Education & Workforce Development with Space Florida, Dr. Larry Chew education coordinator from UCF, and myself engineering tech.

The payload you found was from the academy class that ran from Apr. 30 - May 4 with the launch on May 4th. The winds were not that strong that day. We lost the balloon just off shore from where you found it.

What do I need to do to get the payload back???

Hi Oscar,

OK, and I guess this shows the importance of putting a "return to sender" label on your payloads!

Good luck on your upcoming flights!

BTW, the U PR email server has taken a dislike to me ... sez I'm an "untrusted mailer" :={. Geez, was it something I said?

3146. Freq / Time Slotting GPSL 2007 (prelim)

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-19 14:41:25 UTC
From: Roger Hammond
Topic: 3146 Message: 3146
Attachments: 1 described; binary payloads are missing from this source WARC

Attached is the preliminary frequency assignments and time slots.
There are 11 flights confirmed, I'm still waiting to hear from MECSAT, which would make 12.

Here is the list of confirmed flights:

Bill Brown
EOSS
BUNS
NSTAR
Near Space Ventures
NearSys
ORB
BASE
Taylor University
Nick Stich
Reach For Space

If anyone sees a problem or if I've missed someone's transmitter, let me know as soon as possible.

3149. GPSL 2007 post-recovery addition

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-23 01:24:29 UTC
From: Roger Hammond
Topic: 3149 Message: 3149

For anyone interested we're adding a little something new to the GPSL weekend. Saturday after the launch, chase, and recovery we'd like all of the groups to reassemble back at the hotel for a "How Did It Go?" session. Each group can have about 5 to 10 minutes to tell us about their flight and recovery. After the session anyone that would like to participate in the social hour is welcome to join us. The hotel will provide a cash bar during this time. Here are the additions to Saturday's schedule.

For Saturday, 7 July add:
3:00 PM Cottonwood Room How Did It Go? Informal review of the morning's flights by each group (5-10 mins per group)
5:00 PM Cottonwood Room Social Hour (non-tech session attendees very welcome)
7:00 PM Local Restaurants Dinner

My thanks to Nick from EOSS for his assistance in lining this up.

3150. GPSL 2007 Primary Launch Site

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-23 01:56:55 UTC
From: Roger Hammond
Topic: 3150 Message: 3150
Attachments: 2 described; binary payloads are missing from this source WARC

I think this will likely be the primary launch site for GPSL 2007. I've attached a couple of photos I took this afternoon, to give everyone an idea of what to expect. This is the relatively new Webb Road Sports Field that was finished a couple of years ago. It's primarily a soccer complex, but it has a nice large parking lot. I've been in touch with the city parks department and we're on the schedule for July 7, 2007. There holding tournaments there the following day, so we wouldn't be able to use it if we end up scrubbing on Saturday. It's a nice wide open space in the middle of Grand Island and the only obstacle is a cell tower several blocks away. Unfortunately there are no wind blocks. If you look it up on Google Maps, the field is obscured by clouds.

Here are the coordinates to the front gate:

N40 54.547 W98 22.713

3151. GPSL 2007 Frequency & Time Slotting update

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-23 03:18:27 UTC
From: Roger Hammond
Topic: 3151 Message: 3151
Attachments: 1 described; binary payloads are missing from this source WARC

I've added EOSRED's frequencies to the list. I made one change to the APRS time/freq table. NSTAR's secondary payload will now be on 144.36 instead of 144.39.

I'll upload the PDF to the file section for those who don't receive individual emails.

I've heard from everyone regarding their payloads/transmitters, except for MECSAT. I've tried the only email address that I have for them, but no response. If anyone knows how I might get a hold of them, please let me know. In December they were still planning on attending GPSL 2007.

Time is running short.

3155. Last chance for Helium

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-31 00:32:34 UTC
From: Roger Hammond
Topic: 3155 Message: 3155

My local dealer does not stock T size cylinders. They have to be ordered ahead of time so I need to get the order placed soon. They stock the K size, but not in large quantities. All that being said, if you want to by Helium at the GPSL 2007 price of $40 / K or $50 / T, I need to have the money in hand very soon. The superlaunch website has the form along with a deadline of May 31, 2007 to get the order and the payment to me. I'll extend that to this following Monday, June 4. If I don't have your check or money order to me by then, I'll assume your bringing your own helium or acquiring it on your own.

I've received orders and payment from the following group(s):

BUNS - 1 T
Nick Stich - 1 T
EOSS - 2 Ts
BASE - 2 Ts
NearSys - 1 T
EOSRed - 1 K
NSTAR - 1 T
ORB - 1 K

3157. Foiled Again

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-31 03:08:58 UTC
From: Brek Brixius
Topic: 3157 Message: 3157

There is an interesting item on ebay at the moment. #190117453841

It is an old balloon module made of foil covered cardboard (according to the ad.)

The second camera package I'm putting together for GPSL 2007 - the one for the BUNS balloon is a foil covered foam cooler. I have been debating if I want to leave the foil on or not. It will reflect sun light well. Might help in spotting it on the ground.

Anybody had any concerns about foil on the exterior of a package?

Brek - KC0YOE

Just make sure that the GPS you use is on the outside of the foil. It
may provide more RF shielding for the contents, which is usually a
good thing.

3161. UTARC UX-14 balloon launch 6/9/07

Yahoo group: GPSL (2002 — 2008)
Date: 2007-05-31 14:02:07 UTC
From: David Hoffman
Topic: 3161 Message: 3161
Attachments: 1 described; binary payloads are missing from this source WARC

FOR IMMEDIATE RELEASE
May 29, 2007

Who: University of Tennessee Amateur Radio Club (UTARC) and the Radio Amateur Club of Knoxville (RACK)
What: UTARC UX-14 High-Altitude Balloon Launch
When: Saturday, June 9, 2007 - Time: 9:30 AM Eastern Time
Where: Knoxville Hamfest and Electronics Exposition, Kerbela Temple, 315 Mimosa Avenue Knoxville, TN
Why: Demonstration of technology used to launch and recover high-altitude balloons as well as to videotape flight for replay later at the Hamfest if recovered in time.

The University of Tennessee Amateur Radio Club (UTARC) in cooperation with the Radio Amateur Club of Knoxville (RACK) will conduct a high-altitude balloon launch on Saturday, June 9, 2007 during the 41st Annual RACK Hamfest at the Kerbela Temple in Knoxville, Tennessee. Launch is currently scheduled for 9:30 AM Eastern Time.

The payload, nicknamed ?Eye in the Sky? will contain a video camera that will record the entire flight from lift-off to landing and recovery. This payload is planned for return to the Hamfest in time for replay to the attendees.

Along with a video camera, a 2-meter transceiver and 70cm beacon will be placed on board for tracking in real-time. A GPS receiver will provide telemetry to the transceiver and to an APRS (Automated Position Reporting System) controller that will send coordinates back to ground stations working to intercept and recover the payload after its decent from altitudes exceeding 50,000 feet (weather and prevailing winds permitting).

ABOUT UTARC: The University of Tennessee Amateur Radio Club is celebrating it?s 60th year of operation. UTARC has been launching high-altitude balloons since May of 2005 and their missions have been featured in Make magazine, or publications and the tech web site Slashdot. This launch will be the 14th balloon launch for UTARC. Their balloon missions have taken them as high as 116,000 feet. The payload radio transmissions have been heard as far away as Vancouver, BC and the Caribbean. This year?s balloon launch will mark the 2nd year UTARC has launched from the Hamfest.

ABOUT RACK: The Radio Amateur Club of Knoxville is celebrating its 41st year of hosting the RACK Hamfest, an annual gathering of amateur radio operators and electronics enthusiasts to buy, sell, and trade amateur

radio equipment and participate in seminars dedicated to the amateur radio hobby. The Radio Amateur Club of Knoxville was founded in the 1950s and has served the residents of East Tennessee in times of emergency and public service during its years in operation.

ABOUT THE RACK HAMFEST: The 41st Annual RACK Hamfest and Computer Exposition will be held at the Kerbela Temple in South Knoxville near Baptist Hopsital. This year?s hamfest marks the 2nd consecutive year that the hamfest has been held at Kerbela Temple. Along with the hamfest, the Tennessee section of the American Radio Relay League (ARRL) will conduct its state convention at this year?s event. Various forums including demonstrations of satellite communications, astronomy, HF communications, and youth activities are scheduled.

We made that mistake on one of the UTARC flights. We stuck the GPS in one
of those anti-static bags to keep the rain out.

My APRS capsule has always been covered by foil of some sort. I usually use Christmas wrapping paper or solar blankets. I use 3M-77 spray glue for an adhesive. The APRS capsule now has about 13 flights on it and the foil is still looking good. I also have other capsules covered the same. The foil has definatly aided in finding it on the ground and in trees. As mentioned in other replies, do not cover the GPS antenna with any of it. Ground test when in doubt!

Here at NSS we have ALWAYS covered the box in some sort of a foil. except as already stated, Don't cover the GPS antenna, or if it's a Video or imaging flight of some sort of course you don't want it there either.
but ours are always easy to spot.

Hi Berk,

I guess the answer depends on whether you need help from the sun in keeping your payload warm or not. If the foil is flat and smooth, then it will help its visibility on the ground only if it's reflecting an image that's in sharp contrast to it's surroundings. Depending on its orientation re your eye, it could simply reflect an image of its surroundings. DayGlo orange generally does that quite well on this side of the MS River :=}.

BTW, you may want to consider a sunshade for your camera - even good lenses with anti-reflective coatings can produce sun flair in your pix if the sun hits the lens. We made one out of foamcore sheet, painted flat black. Works OK.

Emissivity of Al varies quite a bit over the IR spectrum. At long IR, it
radiates (and absorbs) quite nicely. And common black anodized Al like
on heatsinks actually reflects near IR (1.3 uM) like crazy!

Thanks everyone for your comments on foil. I have decided to leave the foil on the camera module for the BUNS balloon. It is attached with hot glue and is not a smooth surface. Spray glue may have worked better but the foil is already on. It is not as nice looking as the NSS module (thanks for the photos) :)

My foil covered camera module contains two cameras. One of the cameras is set very deep in the foam. I had to carve out the foam to open clear the camera's field of view. I am hoping that the foam hole that the camera looks through will serve as sun shade enough. I may need to add a sun shade to the other camera that does not set as deep.

My APRS and Beacon are in a separate radio module. Right now, the radio module is in a nice looking white foam cooler. I am thinking about painting the radio module black in hopes of keeping it warmer.

Thanks again to everyone.

3168. Smoking Cutdown

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-03 17:13:11 UTC
From: Brek Brixius
Topic: 3168 Message: 3168

For some time I have been working on a cutdown unit for the BUNS balloon. It is a time delayed cutdown and consists of a 555 timer that drives a 4017b counter/divider in divider mode which drives a second 4017b in counter mode. The purpose of using two 4017b ICs is to produce a long time delay with a relatively small capacitor in the 555 timing circuit.

The next to last output of the second 4017b is tied to the burner circuit which is essentially the same as the FTU described in Paul's book. That lights the nichrome coil and severs the cord to the balloon. The final ouput of the second 4017b is tied to it's own clock inhibit which prevents the burner from lighting more than once.

The timing on my cutdown is fixed at 81 minutes. I chose that time delay because I would like to cut away about 80,000 feet and am hoping to get about 1000 to 1100 feet / minute ascent rate. The reason I don't want to fly to burst is, I would like to be free of the balloon before burst to avoid post burst chaos. I would also like to limit the time in the cold in hopes that it will improve the odds of the batteries/electronics remaining operational. I also like the idea of knowing when the descent phase will begin. Finally, If the balloon is not up as long, hopefully the recovery won't be as far down range as it would if I flew until burst.

The cutdown has been performing well in tests. It runs for 81 minutes 19 seconds and switches on the coil for about 1 minute. The coil then shuts down and remains off. The cutdown has severed 100 lb dacron in about 5 seconds and 145 lb nylon in 8 seconds.

What has concerned me though is that in tests, the cord has produced a flame and a molten glob of dacron/nylon on the earthward side of the cord. The flame burned on after the coil had shut down. In fact the flame burned long enough that my wife decided to step up and blow out the flame.

I should add that the cutdown is packaged in a certafoam block with good clearance for the burner. We did have the lid off to observe the tests.

After brainstorming with my wife some ways we might avoid having the flame, we decided to try some 3M shrink tube - shrunk to fit snuggly on the portion of the 145 lb nylon that runs through the burner coil.

This seemed to work well. When the coil started to glow, the shrink tube produced a lot of smoke but no visible flame. We could see glowing embers inside the coil but very shortly afer the coil stopped glowing, so did the embers. Also the smoke stopped when the coil shut down. There was a black residue left inside the coil which I thought might be difficult to clean out but turned out it wasn't. It crumbled to a fine black powder and was easily removed. The 145 lb. cord took approx. 4 seconds longer to sever with the shrink tube cover. Separation was as effective as without the shrink tube.

Brek,

At 80,000 ft there won't be enough O2 to support a flame, so that shouldn't be a problem.

After brainstorming with my wife some ways we might avoid having the flame, we decided to try some 3M shrink tube - shrunk to fit snuggly on the portion of the 145 lb nylon that runs through the burner coil.

This seemed to work well. When the coil started to glow, the shrink tube produced a lot of smoke but no visible flame. We could see glowing embers inside the coil but very shortly afer the coil stopped glowing, so did the embers. Also the smoke stopped when the coil shut down. There was a black residue left inside the coil which I thought might be difficult to clean out but turned out it wasn't. It crumbled to a fine black powder and was easily removed. The 145 lb. cord took approx. 4 seconds longer to sever with the shrink tube cover. Separation was as effective as without the shrink tube.

From: Brek Brixius
Topic: 3168 Message: 3170

We considered that there isn't much Oxygen up there. We are just concerned for the case where it might get hung up in a tree or have an early burst for some reason and not be at 80,000 ft. when it is ready to cut.

The other thing my wife was concerned about is that the cutdown itself weighs 0.7 lbs packaged in a 6"x6"x8" certafoam block. I am wanting to position it 15 feet above the parachute and tethered to the chute (I want the cutdown back). My wife is concerned that the cutdown unit would fall on and collapse the chute. I have read that the long line between the balloon and the parachute is to allow the burst balloon to fall over the side of the parachute to avoid collapsing the chue. The way I figure, we are either dragging back a 0.7 lb cutdown or a heavier burst balloon.

What do you think?

Thanks Roger.

Subject: [GPSL] Smoking Cutdown

For some time I have been working on a cutdown unit for the BUNS balloon. It is a time delayed cutdown and consists of a 555 timer that drives a 4017b counter/divider in divider mode which drives a second 4017b in counter mode. The purpose of using two 4017b ICs is to produce a long time delay with a relatively small capacitor in the 555 timing circuit.

The next to last output of the second 4017b is tied to the burner circuit which is essentially the same as the FTU described in Paul's book. That lights the nichrome coil and severs the cord to the balloon. The final ouput of the second 4017b is tied to it's own clock inhibit which prevents the burner from lighting more than once.

The timing on my cutdown is fixed at 81 minutes. I chose that time delay because I would like to cut away about 80,000 feet and am hoping to get about 1000 to 1100 feet / minute ascent rate. The reason I don't want to fly to burst is, I would like to be free of the balloon before burst to avoid post burst chaos. I would also like to limit the time in the cold in hopes that it will improve the odds of the batteries/electronics remaining operational. I also like the idea of knowing when the descent phase will begin. Finally, If the balloon is not up as long, hopefully the recovery won't be as far down range as it

would if I flew until burst.

The cutdown has been performing well in tests. It runs for 81 minutes 19 seconds and switches on the coil for about 1 minute. The coil then shuts down and remains off. The cutdown has severed 100 lb dacron in about 5 seconds and 145 lb nylon in 8 seconds.

What has concerned me though is that in tests, the cord has produced a flame and a molten glob of dacron/nylon on the earthward side of the cord. The flame burned on after the coil had shut down. In fact the flame burned long enough that my wife decided to step up and blow out the flame.

I should add that the cutdown is packaged in a certafoam block with good clearance for the burner. We did have the lid off to observe the tests.

After brainstorming with my wife some ways we might avoid having the flame, we decided to try some 3M shrink tube - shrunk to fit snuggly on the portion of the 145 lb nylon that runs through the burner coil.

This seemed to work well. When the coil started to glow, the shrink tube produced a lot of smoke but no visible flame. We could see glowing embers inside the coil but very shortly afer the coil stopped glowing, so did the embers. Also the smoke stopped when the coil shut down. There was a black residue left inside the coil which I thought might be difficult to clean out but turned out it wasn't. It crumbled to a fine black powder and was easily removed. The 145 lb. cord took approx. 4 seconds longer to sever with the shrink tube cover. Separation was as effective as without the shrink tube.

I would think that you would still have the chaos, the chaos is not so
much the balloon popping but the lack of atmosphere to have the chute do
much of anything at all.

how far down range depends more on the winds I.E. "time of the year"
than it does with the length of the flight. We've have had flights that
last over 3 hours and go to over 100,000 feet and land 10 miles away.
and then we've had flights that lasted only a hour or so,, got to
30,000 feet or so,, and traveled over 100 miles away.

no oxygen at that altitude, or surely not enough to support a flame,
never mind the wind it will shortly be having will put it out even if it
did start

I can't help you with the cut down issue you mention.

But, I strongly suggest that you do not use an RC network to determine the delay before actuating the cut down sequence.

R and C have very poor thermal stability. I don't know how well insulated against the outside temperature your payload will be. But, even the best cap is going to have a very big change in capacitive value at the temperatures the balloons payload will reach, even if it is insulated.

If you have accounted for the change in the value of your timing C, then you are fine. But, if you use a disc ceramic cap, you're probably in trouble though! I used a disc ceramic cap in a keyer clock circuit years ago and the variation in the keyers speed was horrible. I learned the hard way....but, I didn't risk losing a balloons payload as you do.

If you must use a capacitor, choose a mylar cap or any of the caps that are designed for use as timing caps.

Enjoy.

As well as the resistor also. we had a flight that used a resistor for a timing portion of a message. and because of the cold it went into hyper speed,, soo fast no one could copy the code, computers were used to read the message and at one point it was like doing 70 WPM!

3174. GPSL t-shirts

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-03 21:33:30 UTC
From: Mark Conner
Topic: 2315 Message: 3174

I'll be working on a GPSL 2007 shirt shortly - May has been a rather busy month. I'll be looking over the photos I have here, but if anyone has a high-quality digital photo you'd like to have considered for the back of the shirt, e-mail it to me directly at mconner1@.... I'd like to have one either from a payload at high altitude, or of a balloon or balloons at or shortly after launch. I'll need it within the next week or so in order to get the design finished so people can order shirts in time.

Ordering will be through Zazzle as it was last year. For those who don't want the headache of working the interface to customize the shirt with your callsign (it's not that hard, though), I'll be willing to do that, have the shirt shipped to my home and will bring it to GPSL on Friday morning. You'll need to order shirts about 7-10 days before you want it in hand.

Ballpark cost on the T-shirts is about $20 for the higher quality shirt. I recommend them as the printing is longer-lasting and more clear. A cheaper shirt can be had for around $14. Polos, kids' shirts, sweatshirts can also be made from the basic design.

E-mail me if you have any questions about shirts.

What would you use instead of the resistor and capacitor?

The cap I am using is a surface mount tantalum. The package is well insulated but, I have a hard time even imagining the degree of cold up there.

My cameras use the same timing circuit (though cheaper caps). Maybe they won't work either. If there is a good alternative, I would be interested. :)

If the cutdown doesn't perform the same as it does here on the ground, there are two possibilities as I see it: 1. The cutdown cuts early and I don't achieve my objective to take a picture of the curvature of the earth. But if the cutdown timer didn't work, the cameras might not eirther. 2. The cutdown cuts late. If it is real late, the balloon will still burst. I'm just up for longer than I figured on.

I guess I don't see a cutdown failure as catastrophic. Still, it would be nice to have some idea how it would perform in the cold. I can't duplicate the conditions up there but, I can remove it from the insulation and pop it in my freezer and see what it does there. If it changes, in my freezer I would guess it would change more on an actual flight.

If the cutdown doesn't do well in the freezer, I'll scratch it from the payload list.

Remember though, this is my first flight. If I scratched everything I wasn't sure of, I'd be flying a balloon with a string. :D

Thank you for your thoughts. I really appreciate hearing them.

I'd forget tantalum and electrolytic, they have bad tempco and
tolerances are generally -5 percent +40 percent. I'm not sure the
electrolyte would be stable at reduced pressure found in the upper
atmosphere. I don't believe electrolytics and tantalums are
hermetically sealed due to the nature of the beasts.

Any disk ceramic or ceramic 'anything' is probably not good.

I'd choose any type of cap made for a timing circuit or for an active
audio filter...Mylar is probably good and polypropylene is good.
Silver mica caps are good, if you can afford them-they're very pricey.

If you are on a tight budget and/or don't want to order a new cap
from a vendor, taking a silver mica cap off a junk pcb will be fine.

If you're writing your own code and have room left over in your PIC,
using the PIC as a timer is hard to beat. Nested (multiple) loops in
software easily obtain large delays with if you don't use a PIC that
has built in timer function(s). As long as your PIC has a quartz
crystal timebase, it will work-you can handle 200 ppm just fine!

If you test it in your freezer (at zero to 5 below zero F) and don't
get more than a 5 percent variance, you're probably fine too. Don't
get paranoid, but do beware::>

Maybe others have some ideas and will comment.

Hey Brek, good luck with the first launch!

3177. Re: [GPSL] Smoking Cutdown

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-04 05:41:54 UTC
From: Brek Brixius
Topic: 3168 Message: 3177

Well I did the test in the freezer and here is what happened. I put the battery in insulation. I left the cutdown pcb (includes everything but the battery) outside the insulation. I put a log tag temperature recorder right next to the pcb. The log tag showed the temperature in my freezer at about 2.5 degrees F. It raised slightly when I would peek every 20 mins or so but averaged about 2.5 F.

At room temperature the cutdown burner switched on at 81 minutes 19 seconds on several consecutive tests. At 2.5 degrees F the cutdown burner switched on at 85 minutes 1 second.

So it runs a little longer.

If I could predict the actual performance, I could switch the cutdown on and hold the balloon for the needed time.

Alas, I am not a PIC programmer. I have often thought about trying it but have not yet made the leap.

Thanks again. I'm glad I did the freezer test and I wouldn't have if you hadn't suggested the effects of temperature on the resister / capacitor. :)

The problem I can see besides the timing components shifting with cold temperatures is if your ascent rate is not exactly 1000 ft/min....even the best laid plans to achieve that rate will vary somewhat.....a more reliable way to have your balloon actually cut down at 80,000 feet or any other altitude you choose would be to use a method used by Norm Kjome.... the aneroid bellows circuit mentioned earlier on another post....these are available cheaply on eBay under "radiosonde"....the old VIZ style will work fine....basically the aneroid bellows is mounted on a U-shaped bracket with a microswitch that closes when the bellows hits it at altitude....you adjust the bellows with a screw mount.....but that does require a bell jar and vacuum pump to adjust it.....another way to do it without needing a bell jar and vacuum pump is to modify the sliding switch contacts on the original VIZ radiosonde such that the contact is closed when it hits the proper switch position....they usually have a calibration chart of pressure vs switch position on those older sondes and this method has worked for me very well in the past.

From: mconner1@gmail.com
Topic: 3183 Message: 3183

PICAXE website:
http://www.rev-ed.co.uk/picaxe/

The 8-pin versions are $4. Nice alternative to PICs if you don't want to bother with getting/making a PIC programmer. About 80 lines of BASIC code available for use (shared with data memory). The resonators are internal so all you have to do is hook up +5V, ground, serial in/out for programming, and whatever sensor you want.

Looks extremely simple and powerful for non-complex tasks like timing circuits, making the barometric cutdown Paul mentioned, etc. You could make a combination time/baro cutdown - have it cut down at a predetermined pressure, or after X amount of time (in case your ascent rate is way too low and you want to avoid an unintentional long-duration flight). The most expensive part of the whole thing is probably the pressure sensor (about $30).

Total parts are probably the PICAXE, MOSFET to switch the nichrome on, pressure sensor, and batteries. You might include a small beeper to go off before the cutdown is engaged so that if it was turned on way before launch you'd have a chance to reset the cutdown rather than have it release your balloon while you're still holding the payloads. The beeper would also be a nice feature to verify correct operation (e.g., beep every 10 sec in normal mode, every 1 sec as a cutdown warning).

Might also want power to the PICAXE/sensors be isolated from the cutdown power (separate battery) so that you don't have a brownout when tripping the nichrome.

Sure wish I had the time to mess with this.

One of the benefits of being a teacher is that I have the time to mess around with this stuff. Your idea is along the lines of what I was thinking. I'll add a pull pin to begin the timer, that way the count down doesn't begin until you're ready to launch.

Paul

The most expensive part of the whole thing is probably the pressure sensor (about $30).

Total parts are probably the PICAXE, MOSFET to switch the nichrome on, pressure sensor, and batteries. You might include a small beeper to go off before the cutdown is engaged so that if it was turned on way before launch you'd have a chance to reset the cutdown rather than have it release your balloon while you're still holding the payloads. The beeper would also be a nice feature to verify correct operation (e.g., beep every 10 sec in normal mode, every 1 sec as a cutdown warning).

Might also want power to the PICAXE/sensors be isolated from the cutdown power (separate battery) so that you don't have a brownout when tripping the nichrome.

Sure wish I had the time to mess with this.

One thing to note about solid state pressure sensors....I'd recommend using the conditioned and temperature compensated sensors that give you a 0 to 5V output...but even these have a calibration curve for temperatures outside of their calibrated range so watch for that....also many of them will not work well above 44,000 feet or so....The venerable MPX5100A by Motorola used to work great up to 99,000 feet but then they decided to cheapen their manufacturing process and now they don't work above 44,000 feet since they no longer work down to a pure vacuum....they didn't even modify their datasheets to reflect that change until a couple of years after making the change (early 90s), so I have a batch of them that still work and a batch that don't (only difference is the date of manufacture code)....so some testing might be in order....keep in mind also that as you go higher in altitude, the error of the sensor will be much greater since the voltage increment for each ADC count is now a significant fraction of near vacuum...so basically what would be a 100 foot error at sea level could be thousands of feet plus or minus at 90,000 feet......I've discovered that many existing pressure sensors by Sensym and the like are no longer in stock anywhere...they were bought out by Honeywell and my guess is that Honeywell is trying to weed out the Sensym line in preference of their own much more expensive line of transducers......part of the problem may also be presumably because of the RoHS mess as manufacturers try to make lead-free products.
If you look at Digikey under "Pressure Sensors" you'll see that there are lots of likely candidates for balloons but very few are actually in stock and only the terribly expensive ones seem to be available.

So, perhaps the best option (certainly the cheapest) is to use the surplus radiosonde pressure sensors..these are designed to maintain a decent error limit all the way up to above 110,000 feet so are a natural for ham ballooning....the VIZ ones use a slider over multiple switch contacts (I'll try to post a photo soon of how to modify one of these for altitude indication) - I built one to send down the switch contact number whenever it made a transition to a new level which tracked great on the way up...but doesn't work after burst since I only looked at the transition and not absolute switch position (i.e only works for ascending switch positions), post-burst chaos tends to make it bounce a bit as well, so this will only work for ascent but should work for specifying a cutdown altitude during ascent .... The newer Vaisala surplus sondes (also on eBay) use a variable capacitance pressure sensor....the chip on that board converts the capacitance sensors into an audio frequency which sequences through Pressure, Humidity, Temperature, Internal Temp and a high and low reference tone (to calibrate for temperature drift)....they send out these tones over the period of slightly greater than one second....I'm in the process of converting some surplus Vaisala RS80 sondes I got on eBay to decode the audio tones with a small microcontroller....this is exactly how the Ozonesonde decodes the Vaisala sensors and then converts it into an ASCII message that it sends down at 300 baud...it uses a PIC chip. The only problem with

this approach is that although Vaisala provides you with the calibration coefficients, they don't tell you the curve-fitting formula so you'd have to once again calibrate it with a vacuum bell jar....although one way around this would be to fly it on a GPS equipped balloon and compare the two and calibrate it that way (provided you are able to recover it)...a real-world vacuum chamber.

Yeah, thin air and possible trans-sonic local airflow probably have
something to do with PBC. But the major culprit is parachute instability,
as I discussed at GPSL last year.

In a nutshell, parachute instability is caused by the high pressure bubble
under the canopy trying to vent out one side of the skirt, causing a
reaction force that tips the 'chute even farther. Parachutes don't work so
well flying sideways. This asymmetrical venting continues until the bubble
is depleted enough to let the 'chute re-erect, and the cycle starts all over.

The cures are:

1. Provide a generous vent at the apex, even tho it increases landing
vertical velocity. At least 4" diameter on a 5 ft, preferably 6".

2. Get rid of any shards hanging off the apex after burst (or release).
And do it PDQ before the shards have a shot at entangling the shroud lines.

3. Put your fastest-falling payload at the bottom of the flight string to
server as sort of a "plumb bob" to counter any incipient instability and
to expedite re-erection.

Hi Brek,

Sounds as though you're overdriving your burner. It only has to get hot enough to melt the lift line enough so that it pulls apart under tension. The EOSS burner for the kind of line you're using is 2 ohms of #28 or #30 AWG NiCr fed from 2 seriesed CR123 LiSO2 N-cells thru a 5A relay. The coil is tight-wound over the line, but just tight enough to let the line move thru the coil so it can be placed properly. It gets the job done in 4 sec, so we limit our "burn" to 10 sec. If it glows brighter than a dull red in surface free air with no line, then it's too hot.

We cover the coil with some refractory ceramic insulation and enclose it in 1/2" thickness of styrofoam to keep the wind off. And another trick is to keep about 3" of the leads feeding the coil inside the foam enclosure to minimize conducted heat transfer thru the copper to the outside world. You'll notice that the coil gets hotter in the middle than at the ends where the leads attach.

With this configuration, the worst we've seen emerge from the burner is a wisp of smoke, and then it was with another club's timed cutter that failed before launch. With a 10-sec burn, nothing comes out except the melted lift line.

Hi Brek,

Holy shamoley! The EOSS mechanical baro-armed release with backup burner weighs just 168 gm (0.4 lb) and is rigidly bound to the load risers at the apex. We carry the batteries and relays (100 gm) in a pouch sewn to the inside of the parachute canopy about 2 ft below the apex. That 0.7 lb chunk above the 'chute is as likely to destabilize it as much as the shards from a normally-burst 1200 gm bag. Suggest thinning down your enclosure and attaching it directly to the 'chute apex above the vent (at least 4" diameter for a 5' 'chute).]

Or, one could just build a 60-sec cycling DF beacon with a 30 sec
listening period and a DTMF decoder to let you command a cutdown at will.
It works well.

Hi Brek,

Hmmm ... guess I should looked at the 4017 specs first. It's just
a 5-bit BCD-coded counter, so 2 of 'em cascade will yield just
a 100:1 clock from your 555 oscillator. For a 81-minute cycle, that
means your osc must run with a period of 0.81 minutes or 48.6 sec -
using a 1 meg R (max that I'd ever use with a 555, you need a 48.6 uF
cap, meaning an electrolytic, which not only is temp sensitive but also
about as leaky as a 1 meg.

Suggest you replace both 4017's with a 4020 14-bit ripple counter which
can give you fclk / 16,384. This will let you run your 555 at 3.37 Hz,
which gets your RC = 0.297 sec. A 0.33 uF mylar cap and 910K metal film
resistor would get you there. Then use a 4068 8-in NAND to decode a
10 sec (clk / 32) pulse to fire your burner every 81 minutes.

Or, you could just bite bullet and use a Basic Stamp I ...

To Brek's credit, he's running his 555 with a low enough RC time
constant to avoid using electrolytics! Your suggestion to use a
plastic vs ceramic cap is quite sound, however.

Art's suggestion to use a domestic freezer as a cold soak chamber is
is a good one. Although it only goes goes down to 0F (-16C), while
one can see -80C at the tropopause, by the time you get there (100 mbar or
less), the air's too thin to convect much heat away, and the enclosure
also helps keep internal temps above -20C in most cases anyway.

If the circuit runs after a powered-down soak outside the enclosure at
-16C for 4 hrs or so, it's good of for a normal daytime latex flight.

BTW, we've flown gobs of tantalums and even aluminum electrolytics to
above 100K' (< 10 mbar) with no adverse effects. We're only talking
about under 15 psi pressure change here.

Chuckle, chuckle. Well in that 0.7 lb. I was leaving some room to add some duct tape. You know, just 4 or 5 wraps (each direction) to keep the lid closed. lol.

Yeah, I have a problem with making things too heavy.

I am really enjoying everyone's thoughts on this cutdown issue. I am just a beginner when it comes to building circuits. So far, I have a camera timer circuit that works fine on my Kite. I also have the cutdown unit that has a bank of surface mount led's next to each 4017b and I can watch it step by step and then trigger the relay. It sounds dumb but, it is really satisfying just to be able to get that far. And it is fun to show people and listen to them say, "Ooooh, Yeah..... What is it?". lol

I agree with you Mike, I am overdriving the burner. Originally, I tried driving the burner with a stop watch like Paul mentions in his book. The on/off signal cycled the reed but the burner coil didn't always glow. I didn't understand that it probably doesn't need to glow to be effective. So I tried latching the relay with a capaictor accross the reed relay's coil. That worked too well and the reed remained latched after the signal ceased.

When I get around to it, I need to also add a debounce for cutdown switch. Right now I am working around it by using two 9 volt battery snaps. I pop one set of snaps together and then ease the other set together. Since I have plenty of LEDs on the board, I can tell when it starts in the initial position.

I am also interested in the Picaxe (even though the name reminds me of a very bad Magnavox Oddessey 2 video game from the 80's - Pickaxe Pete). I ordered some Picaxe-08M to play with when I get a chance.

I am convinced though that my cutdown needs some more work. I don't think I'll have time to redesign it before GPSL 2007 either. So plan B, I guess is to leave the cutdown off, dump the full T tank in and fly to burst. Sound like a plan?

Thanks
Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Brek,

Holy shamoley! The EOSS mechanical baro-armed release with backup burner
weighs just 168 gm (0.4 lb) and is rigidly bound to the load risers at the
apex. We carry the batteries and relays (100 gm) in a pouch sewn to the
inside of the parachute canopy about 2 ft below the apex. That 0.7 lb
chunk above the 'chute is as likely to destabilize it as much as the
shards from a normally-burst 1200 gm bag. Suggest thinning down your
enclosure and attaching it directly to the 'chute apex above the vent
(at least 4" diameter for a 5' 'chute).]

3196. Re: [GPSL] PICAXE for cutdown

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-05 14:03:47 UTC
From: PAUL VERHAGE
Topic: 3183 Message: 3196

I have most of the cutdown designed and because we have finals today, I think I can finish during class. It uses a PICAXE-04 and has a temperature and pressure sensor as inputs. The PICAXE can be programmed on the cutdown PCB, so the code can be tweaked without removing the chip. I'd recommend using the PICAXE-08M so it can do some data logging during the flight. That feature should allow us to adjust the code for best performance. I want to program it to cut away the balloon based on time, change in temperature, or on pressure (and change in pressure). Adding a datalogging feature measures cramming a lot of code into 256 bytes. Does anyone have a micro shoe horn?

The pressure sensor is a SM5812 which I've had pretty good luck with. The temperature sensor is a thermistor and 47k resistor. A 47k resistor, according to my calculations, gives you the greatest sensitivity in the voltage dividing temperature sensor. The thermistor is the tiny Radio Shack one and should be mounted outside the cutdown enclosure so it senses temperature changes. The PCB will be small and use two batteries, one for logic power and the other for the burner.
I should have several boards and will bring them to GPSL.

Paul
>>> <mconner1@...> 6/4/2007 8:27 AM >>>
PICAXE website:
http://www.rev (http://www.rev/)-ed.co.uk/picaxe/

The 8-pin versions are $4. Nice alternative to PICs if you don't want to bother with getting/making a PIC programmer. About 80 lines of BASIC code available for use (shared with data memory). The resonators are internal so all you have to do is hook up +5V, ground, serial in/out for programming, and whatever sensor you want.

Looks extremely simple and powerful for non-complex tasks like timing circuits, making the barometric cutdown Paul mentioned, etc. You could make a combination time/baro cutdown - have it cut down at a predetermined pressure, or after X amount of time (in case your ascent rate is way too low and you want to avoid an unintentional long-duration flight). The most expensive part of the whole thing is probably the pressure sensor (about $30).

Total parts are probably the PICAXE, MOSFET to switch the nichrome on, pressure sensor, and batteries. You might include a small beeper to go off before the cutdown is engaged so that if it was turned on way before launch you'd have a chance to reset the cutdown rather than have it release your balloon while you're still holding the payloads. The beeper would also be a nice feature to verify correct operation (e.g., beep every 10 sec in normal mode, every 1 sec as a cutdown warning).

Might also want power to the PICAXE/sensors be isolated from the cutdown power (separate battery) so that you don't have a brownout when tripping the nichrome.

Sure wish I had the time to mess with this.

Hi Brek,

"Things should be made as light as possible, but not more so", with
apologies ...

Guess I'm surprised that more folks didn't suggest using a Basic Stamp I
for your timer. Not familiar with the PICAxe chip, but having coded
PICs in assembly in a former life, I suspect the learning curve may be
a lot steeper than for the BSC - only advantage is hardware cost.

Not sure what you mean about the "reed" (reed relay?) and the cap that's
holding it in. Are you using an SCR to drive the burner directly or the
relay coil? The piezo beeper output from a stopwatch can work fine,
but you'll need some external gain to bump it up to the level that can
drive a relay - an SCR would do that, but unfortunately, SCRs latch ON
until the load current is cut. A power FET, like a 2N7000 would also
work to drive relay coil, but it's not strong enuf to drive the burner
coil directly.

re the CMOS counter: you can keep the LEDs - just tie 'em into the
binary outputs of the 4020; makes just as interesting a display.

The VIZ anaeroid baroswitch approach that Bill WB8ELK suggested has merit
in that it will keep the burner running only until the altitude drops below
the setpoint minus some hysteresis. So you'd not have to worry about
it lighting off on the deck. The microswitch contacts are good enough
to handle the burner current directly, so the whole shebang would comprise
the burner, baroswitch and batts plus some minimal insulating enclosure.

I could loan you a baroswitch for GPSL and calibrate it to fire at 80K;
a loan, since I'm running short of anaeroids at the moment. Interested?

From: PAUL VERHAGE
Topic: 3200 Message: 3200

Here's an email about the pressure sensor I'm using for the PICAXE Terminator. The sensor looks pretty good and has worked well with my near space miniature weather station. It's radiometric and runs off of 5 volts.

Paul

PS, there's three left, since I just ordered one.

Paul,

Thank you for your inquiry.
Our computer says we have 4 pieces.

Cost: $24.00 each.

Thanks
David

Subject: [SGSatellites] Digital payload camera?

Hello all,

A question for the collected knowledge here: I'm looking to upgrade our payload camera from the Colorado workshop Elph LT to digital (APS film is getting harder to find here, 40 exposure rolls need to be special ordered, and processing cost has skyrocketed). What digital cameras do any of you use? I need it to be modifiable like the Elph for external triggering.

Megapixels are not really a concern, anything over 2 is fine. Of course, size and weight are. I'd also like it to use SD cards if possible. Finally, a target price of around $100 (or less?) would be nice.

Thanks for your help.

Well, if the PICAxe has on-board ADCs and I^2C, then that's a couple
of steps above the BSC1. The EOSS CW/DF/Cutdown module uses perzactly
100% of the available EEPROM - If I had a 6-char call sign, it wouldn't
fit.

Hey, thanks, Mark!

I was kinda wondering when Microchip might grab a piece of the Parallax action. I'll take a peek at those links and see how much wallet burden the corresponding development system demands.

That's not to say that I'm gonna start genning code, tho. I have an ICE-22 with ASM and C+ for a bunch of now-obsolete flash PICs still waiting for that elusive round tuit to arrive ... :={

Could you send me the specs? Remember that at 100K', we're trying to
measure just 1% of full scale, and some pressure sensors have at least
1% accumulated scale and tempco error.

BTW, I think you meant to say "ratiometric".

3206. RE: [GPSL] Fw: [SGSatellites] Digital payload camera?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-06 02:20:08 UTC
From: Patterson, David
Topic: 3201 Message: 3206

Taylor University has had a lot of success with inexpensive (~$60) cameras from Wal-mart like this one: http://www.walmart.com/catalog/product.do?product_id=5640635. Because of the single-action shutter button, hookup is fairly straightforward, and, with a high capacity SD card and lithium batteries, it doesn't seem to have any trouble staying on and taking pictures for the entire flight.

One thought: because CCD imagers are sensitive to IR, there are filtration options that don't work well with standard film.

Hope this helps!

3207. Re: [GPSL] Smoking Cutdown

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-06 03:05:42 UTC
From: Brek Brixius
Topic: 3168 Message: 3207

My understanding of the Picaxe is that it is just a PIC that has a BASIC interpreter already loaded on it. You just hook it up to a serial port or usb and program it with free software that the manufacturer provides. According to what I read, you can program it with BASIC or by drawing flow charts. It looks real simple. With one line of code, you can tell the Picaxe to pause for however long you want it to wait. Then the next line of code can turn an output pin on... or off (hi / lo). The only drawback I can see is that it can only store about 80 lines of code. For the simple things I am doing, that should be just fine. I am really excited to see what the Picaxe can do when I get it.

Regards to my attempted cutdown unit: The burner control is the same as the Flight Termination Unit described in Paul's book. I am not using a silicon-controlled rectifier (SCR). I had to look that up. Like I said, I am a beginner. Any rate, the FTU described in Paul's book consists of a resister, transister, diode and reed relay and the burner coil. The signal line goes through the risistor to the transistor to the reed relay. When the reed relay switches on, the burner receives full power from the battery through the burner coil then the relay switch to ground. The 4017b provides a strong steady signal that keeps the relay on so the burner coil runs at full potential (at least as I understand it). The diode sets across the reed relay coil and protects the relay when the field collapses.

When I tried using the beep signal from the stop watch as the signal input for this circuit, the reed relay cycled on and off and didn't allow the burner coil to get very hot. So, I told a friend of mine who has some understanding of electronics. He suggested using a capacitor positioned across the reed relay coil to set up what he called a resonant circuit. He said the value of the cap would require experimentation but that the relay could be latched using this technique. I tried several caps and the rate of cycle of the reed relay did change. I finally hit upon using two .01uf polyester film caps in parallel. That resulted in brief cycling of the relay (3 or 4 cycles growing closer together) before the relay stayed in the on position and the burner coil got extremely hot. I then disconnected the power to the circuit.

The barro switch does sound like an elegant solution. Are you that sure my APRS is going to work? I would hate to loose your switch Mike.

Right now, I am thinking maybe I should keep my first flight pretty simple. I'm not sure if my stuff will work or even how to string it up. BTW, do I need some swivels?

Thanks,
Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Brek,

"Things should be made as light as possible, but not more so", with
apologies ...

Guess I'm surprised that more folks didn't suggest using a Basic Stamp I
for your timer. Not familiar with the PICAxe chip, but having coded

PICs in assembly in a former life, I suspect the learning curve may be
a lot steeper than for the BSC - only advantage is hardware cost.

Not sure what you mean about the "reed" (reed relay?) and the cap that's
holding it in. Are you using an SCR to drive the burner directly or the
relay coil? The piezo beeper output from a stopwatch can work fine,
but you'll need some external gain to bump it up to the level that can
drive a relay - an SCR would do that, but unfortunately, SCRs latch ON
until the load current is cut. A power FET, like a 2N7000 would also
work to drive relay coil, but it's not strong enuf to drive the burner
coil directly.

re the CMOS counter: you can keep the LEDs - just tie 'em into the
binary outputs of the 4020; makes just as interesting a display.

The VIZ anaeroid baroswitch approach that Bill WB8ELK suggested has merit
in that it will keep the burner running only until the altitude drops below
the setpoint minus some hysteresis. So you'd not have to worry about
it lighting off on the deck. The microswitch contacts are good enough
to handle the burner current directly, so the whole shebang would comprise
the burner, baroswitch and batts plus some minimal insulating enclosure.

I could loan you a baroswitch for GPSL and calibrate it to fire at 80K;
a loan, since I'm running short of anaeroids at the moment. Interested?

The PICAXE is a microchip PIC programmed with a BASIC interpreter. It's more like a UK version of the BASIC Stamp (which started out as a programmed PIC and is now moving into Scenix, err, Ubicom, err Parallax microcontroller).

I have an article on using the PICAXE as a flight computer that fits inside a ping pong ball. Do you need an instrumented ping pong ball?

Paul

>>> Mike Manes <manes@...> 6/5/2007 7:30 PM >>>
Hey, thanks, Mark!

I was kinda wondering when Microchip might grab a piece of the Parallax action. I'll take a peek at those links and see how much wallet burden the corresponding development system demands.

That's not to say that I'm gonna start genning code, tho. I have an ICE-22 with ASM and C+ for a bunch of now-obsolete flash PICs still waiting for that elusive round tuit to arrive ... :={

There's other models of the SM5812 designed for smaller (and higher) pressure ranges. I'll find the datasheet and email the link.

Paul

>>> Mike Manes <manes@...> 6/5/2007 7:41 PM >>>
Could you send me the specs? Remember that at 100K', we're trying to measure just 1% of full scale, and some pressure sensors have at least 1% accumulated scale and tempco error.

BTW, I think you meant to say "ratiometric".

>
> I have most of the cutdown designed and because we have finals today, I think I can finish during class. It uses a PICAXE-04 and has a temperature and pressure sensor as inputs. The PICAXE can be programmed on the cutdown PCB, so the code can be tweaked without removing the chip. I'd recommend using the PICAXE-08M so it can do some data logging during the flight. That feature should allow us to adjust the code for best performance. I want to program it to cut away the balloon based on time, change in temperature, or on pressure (and change in pressure). Adding a datalogging feature measures cramming a lot of code into 256 bytes. Does anyone have a micro shoe horn?

Been there, done that before. Good luck squeezing the code.

>
> The pressure sensor is a SM5812 which I've had pretty good luck with. The temperature sensor is a thermistor and 47k resistor. A 47k resistor, according to my calculations, gives you the greatest sensitivity in the voltage dividing temperature sensor. The thermistor is the tiny Radio Shack one and should be mounted outside the cutdown enclosure so it senses temperature changes. The PCB will be small and use two batteries, one for logic power and the other for the burner.

Would you have better luck, rather than using a poorly calibrated thermistor, using something like a National Semiconductor LM19 temperature sensor IC (in a TO-92 package)? 2.4V to 5.5V supply voltage at 10 microAmps of current. +130C to -55C temperature range.

http://www.national.com/ds/LM/LM19.pdf

Digikey has them for US$1.11 (which may even be cheaper than the Radio Shack thermistors!).

Yeah, yeah, I know. Don't you just hate engineering changes late in the design cycle. ;-)

Be sure to obtain heavy-duty swivels, well in excess of the load ratings you might thing you need. See here for why:

http://www.nstar.org/nstar2000-01.html#01B

I've stopped using them altogether, and instead use braided load line to try to reduce twisting.

Hi Billy,

Thanks for your inquiry, and congratulations on getting aboard the ballooning bandwagon!

I assume that by "four countries" you meant "four counties" - this is important, since international civil aviation regulations regarding unmanned balloons are far from harmonized.

I guess the best answer that I can give you re a flight computer is "It depends ...". But it is important that you carry a tracking beacon that transmits the balloon position thruout the flight, plus a redundant DF beacon for insurance and to expedite recovery using DF after it lands.

I'd recommend building your APRS beacon using a Kantronics KPC-3+ 1200 baud packet TNC, coupled with a GPS receiver/ant and a 2m handheld FM xcvr on 144.39 MHz, the APRS backbone freq. The KPC-3+ can be configured to generate a variety of APRS frames, and it also has 2 analog telemetry channels which can be expanded to 5 via minor surgery. It also supports digipeating and a 100K mailbox. So the KPC-3+ is about as close as you can come to an off-shelf flight computer.

The DF beacon should be entirely independent from the APRS beacon, and it can be as simple as an HT and a simple processor to generate MCW ID - like a Basic Stamp or a Microchip PICAxe.

Note that there are no Payloads-R-Us stores, so be prepared to do some designing and homebrewing to get your first payload string ready to fly.

EOSS uses a variety of APRS mapping software on the ground, but the most popular is UIView which operates with uSoft MapPoint maps.

You may also consider downloading some other freeware software from the EOSS web site, www.eoss.org

Liftwin is handy for figuring gas fills, and WinBallTrak does a good job of forecasting a flight trajectory based on some on-line wind models.

I've cc'ed this reply to the GPSL yahoogroups reflector, where you can post queries to the ARHAB community at large, and to Ralph W0RPK, who's got a great web site on ballooning, including suitable GPS engines. Ralph also sends out frequent ARHAB flight announcements for US and international balloon groups.

I hope this helps a little, and don't hesitate to inquire further. Good luck on your first flight!

In my experience, nothing >prevents< payload or balloon rotation other
than a driven platform. Braided line is definitely the best choice for
line, however.

Hi Mike, et al.,

By way of further introduction of Billy Graham, he is the chair and lead instructor of the Electronics Technology Department of the Northwest Technical Institute in Springdale, Arkansas. Recently he received a small grant from the Arkansas Space Grant Consortium to develop a balloon satellite program at NTI, which covers the five counties surrounding Springdale. I am sure that any mentoring you all can give Billy will be most apprciated by him because he is so new to ballooning and this aspect of our hobby. More of his story will be printed in the July issue of my VHF Plus column in CQ magazine.

I wasn't thinking along the lines of preventing rotation of the payload. I was wondering if the rotation would twist up the parachute shroud lines? If it works without swivels, great because we don't have very big fish around these parts and I'm not sure where I would get very large swivels. :)

I now have plenty of 145# braided nylon line. Since I didn't pay attention to how the balloons were strung up last year, I am planning to bring a selection of line with me.

Thanks
Brek.

Hi Brek,

If you have a spreader ring on your shroud lines, they won't twist up,
and the 'chute will pop right open immediately on initial descent.

We used to use swivels and found them essentially useless. We'll have
a supply of line with us at GPSL, but that 145# braided nylon oughta
work fine. Just be SURE it's nylon and NOT dacron! Dacron doesn't
stretch much up to the yield point, so it tends to snap during PBC.
(Been there, done that). Nylon will stretch up to 150% and thus acts
like a nice shock absorber.

A quick and easy spreader ring that attaches easily to the shroud lines
below the parachute canopy are the plastic 2-ring embroidery hoops available from
Walmart....one ring goes inside the lines and the other is screwed to the
outside and works quite well.

We also use the WalMart embroidery hoops to spread the
shroud lines, but we tie the hoops together with
several zip ties between the lines around the
perimeter of the hoops.

I do something similar.

I epoxy the inner and outer rings of a wooden embroidery loop together.

to minimize any useless weight, here at NSS we use a single of the rings, and have the lines make one wrap around the hoop. and a small dab of hot melt glue to hold it in place when there is no tenstion on the lines.

Great! We have a Walmart :) I'll look at the plastic ones. I wonder if they have the wood ones too. I have worked a lot with wood and epoxy. Makes a great combo. BTW, if you are trying to plug up a hole, you can mix fillers into epoxy to give it strength (like milled or stranded glass) or colors (like graphite) or just use less epoxy. Whole wheat flower makes a nice filler. Don't use too much of any filler though or you loose adhesion.

Also, I got the message about the Instrumented Ping Pong Ball. That is amazing. I noticed there are now surface mount Picaxes too. I assume they are smaller like other surface mount DIPs. Maybe you can make Picaxe Terminator (PT) and his sidekick Mini PT.

Brek, there is also a product called "Micro Balloons". They makes an excellent filler. A 50/50 mix with epoxy works great. Try your local hobby shop.

For our 10-ft chutes, EOSS uses a 3' diameter 1/4" wicker hoop. Not sure
one can get a 3' embroidery hoop. Also have a hula hoop on hand to try out.
A bit heavier than the wicker, but a lot stiffer.

We've had bad luck with epoxy on externals of balloon payloads. Bill Brown's 35mm camera took a shortcut to the deck from where it was epoxied to the top of one of our earlier shuttles. Of course, there are a large variety of epoxies, but we've never had a >>properly applied<< hot melt joint fail; that means both surfaces are burnished and heated to the flow temp of the hot melt glue. Best plan is belt & suspenders, however.

Or the trail of broken-off bits of payload string if it's windy at the
the recovery site. Funny how losing enough payload weight will let the
remaining balloon fly again! Been there, done that, too.

3239. Helium Rationing now in effect in Kentucky

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-09 00:04:46 UTC
From: wb8elk@aol.com
Topic: 3239 Message: 3239

Well...I had heard rumors that this might happen in the near future...but it's a reality now....Hank W4HTB and myself are planning to fly an ATV repeater balloon on June 16th from Bowling Green, KY....when Hank tried to get a helium tank delivered from his local Airgas distributor he was told that helium is on allocation and is only being delivered to existing customers and they are taking no new helium customers at this time.....sure doesn't sound good for the future of helium. They managed to get a local party balloon supplier to order a tank for them...at a cost of $80.

- Bill WB8ELK

3240. Helium tank requests for the 20th anniversary ARHAB celebration in Ohio on 8/11

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-09 00:10:04 UTC
From: wb8elk@aol.com
Topic: 3240 Message: 3240

Here are some details on the upcoming 20th anniversary ARHAB celebration:

Where: 5 miles east of Findlay, Ohio on the farm of George WA8HDX....the launchsite of my first ARHAB flight in 1987.

When: 9:00 am EDT on August 11th.

All are welcome to participate in a group balloon launch and chase similar to a GPSL group launch.

I would like to get an idea of who needs helium (and how many tanks - 291 cu ft) for this event so I can get an estimate of costs from the local gas supplier.

Please email me with your helium requests and I'll find out the cost:

Ditto up here in Wisconsin, (not that it matters to me,, always used hydrogen anyway) but one of the guys was checking on price comparisons, and HE is not available at all.

I think it's that the HOT MELT stays soft,, somewhat like silicone
rubber stuff.

The nicest thing i like about the hot melt stuff is that when the flight
is over you can easily peel the stuff off with no damage to anything..
yet it will NOT come off on it's own

cool crap!

3243. Re: [GPSL] please pass the infro about pic chips where is a good source and

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-09 01:22:39 UTC
From: Zack Clobes
Topic: 3235 Message: 3243

I've done a lot of PIC programming. I use the CCS compiler (www.ccsinfo.com)and a WARP-13 programmer (I'm not sure on the current availability of these anymore). You're basically looking at about $200 to get setup for Microchips PICs. My big gripe over the years is that the quality of the CCS compiler is a bit lacking, it's not cheap to stay on the most current version, and you get married to one series of parts (i.e. 12bit, 14bit, etc...).

Recently, I've been exploring Atmel AVR processors. The programmer is cheaper (about $40 as I recall), and there's a good C complier (WinAVR) that's open source. I'm in the process of porting some of my PIC code over the Atmel series of processors. So far it's going slow but steady.

Here is a shameless plug for my web site:

http://www.kd7lmo.net/

There are a number of open source PIC and ARM7 projects that you might be interested in...

Actually this is been a long time coming, un-like hydrogen, helieum can not be man made, it is found in Natural gas fields in Texas and Wyoming. It's extracted from the gas, then stored in an underground federal facility as a hedge against the coming helium shortage. Well, that's what the government anticipated back in 1960, when Russia was the only other country producing a significant amount of it. Some radioactive elements, such as uranium, release alpha particles when they decay. An alpha particle is just a helium atom with no electrons. Deep in the Earth where these radioactive decays take place, the alpha particles capture electrons and become helium. As the radioactive deposits age, large quantities of helium become trapped in underground caverns. To collect the helium, people drill down into the caverns and capture the helium as it escapes.

So i'm assuming the supply like all other "Fossil Fules" is starting to run out?

Thanks Joe,

I remember reading about helium availability being low in the WW 2
and slightly beyond.....but didn't realize there was a helium shortage today.

I thought the US had tremendous natural gas reserves, so never
thought of helium as being a problem since we learned to drill deep
enough to tap natural gas in the Earth's crust.

I'll tell my wife, she orders helium to make helium balloons for
promotional purposes at her work place.

Here are a couple articles on the supply issue -

http://www.boccanada.com/en/aboutboc/news/?action=view&article=37

http://www.weldingmag.com/323/News/Article/False/39575/

It sounds like the same thing as gasoline pricing...we have all these
"problems and issues" with production, so you'll pay more.

Bummer!

Well, that's our tax bucks at work. The He shortage is rumored to
have stemmed from a BLM quota reduction of He production from gas
wells. Mike KJ0R may be able to shed some light ...

And better watch out for "balloon" gas; it's heavily diluted with N2, as
ANSR sadly discovered on one of their early flights. The N2 is added
to slow the gross leak rate out of mylar balloons.

Might consider going to a welding supply house or using H2?

That camera was admittedly a high-stress application, being cantilevered
off the top of the shuttle. PBC no doubt did a job on it. Shoulda added
a safety line. Lesson learned.

From: Brek Brixius
Topic: 3236 Message: 3253

I got my Picaxe (a pic with a BASIC language interpreter installed by the manufacturer).

I love it! I didn't have time to design and etch a printed circuit board for it so, I just bought Radio Shack part #276-0159 Dual IC Board, separated the halves and dropped a 16 pin IC socket on one half.

My Picaxe-08M is only an 8 pin DIP but I loaded it in one end of the socket and wired the programming lines and outputs back to the other end of the socket with jumper wires. You also have to put two resistors on according to instructions available in the manufacturer's literature.

The only thing that I thought was unclear from the manufacturer's diagram was whether the Picaxe should be powered during programming. They show a minimum programming diagram and a minimum operating diagram. The minimum programming diagram does not show a power supply connected but, you need one. The Picaxe is a 5v part but, I was able to program it and experiment with it on 3v (2x AA). I'll want to use a 5 volt power supply when I set it up for the balloon though.

I made a programming cable from a 9 pin serial female connector and hood (also available at radio shack), a piece of telephone wire and 3 prongs that will fit in the open spots on the IC socket.

I downloaded the programming editor from the manufacturer's web page (free download). Installed it on a Windows 98 laptop and I was off and running.

I also put some LED's on the outputs and was making the LED's flash in different patterns. My daughter said, "Nice, but can you make it play Jingle Bells". I looked in the manual and was amazed to find that Jingle Bells is built into it. It can also play 3 other standard tunes or download and play cell phone ring tones.

For the sound output I am using an 8 ohm speaker and a 33 ohm resister. I just soldered prongs onto the leads. After I download the song I want to hear onto the Picaxe, I disconnect the programming cable and plug the speaker leads into the open part of the IC socket to hear the song. Be sure to program it to loop or you might miss it.

Well, if the Picaxe can do all this fun stuff, it can also click a picture on a digital cam every so often or flip a relay on.

What a great thing. Cheap, useful, fun. Hard to beat it in my book.

>We used to use swivels and found them essentially useless.

The kite people use swivels too and find them essentially useless as well. They have to much internal friction to prevent the line from twisting although they minimize the line twisting-but don't stop it completely.

I did find some specialty swivels that appear to work however. They are slightly pricey (60 to 80 cents each), but they come in 100 to 300 pound ratings so they are quite strong. They are made out of stainless steel and have bearings in them, which is why they work so well.

Haven't tried fishing with them, but they are just awesome for kite flying. I flew one on a micro sled kite that was very prone to line twisting. When the line twists, the opposite ends of the lifting surface come together and the kite collapses-and falls from the sky. I had allot of experience with this kite in particular and it had been frustrating as nothing seemed to work. Even tried dual and triple swivels. But, changing to a single high quality ball bearing swi9vel fixed the problem.

Buy them from any kite flying store.

Enjoy.

The PICAXE terminator PCB is complete and I'm running some tests on it while I wait for the pressure sensor. Radio Shack no longer sells the thermistor I was planning to use, so I'll order one from Jameco.

Paul

PS, give the PICAXE power while programming.

So hydrogen is our only alternative...?

Has anyone here used H instead of He, and other than the flammability issue, are there any other drawbacks to it? I've never checked on the price, so how does that compare to He?

I suppose if this is going to be a semi-permanent shortage (not sure from reading the articles), I'll at least need a new regulator.

I just checked with my He supplier here in Tulsa and he says he has plenty right now and hasn't heard any rumors about a shortage. I deal with a small Mom-Pop operation for He, but he doesn't have H. I would not even try to deal with AirGas (AG). A while back I went to AG to see about H and they wouldn't even talk to me, even after I produced an ORB business card and showing Fire Service credentials. They started in on a liability issue and just flat said NO. I've found 4 other small local welding & gas suppliers that said I could have all the H I wanted. I don't remember what I was quoted on it.

Search this GPSL Yahoo Group for "Hydrogen" and you will find a couple threads on H from back in Jan of this year. Also there is this about the price I was quoted...

"I checked on the price and availability of Helium here in Tulsa yesterday. It has gone up $10 for a K bottle and availability is not guaranteed. I also priced Hydrogen, which is $30 for a K bottle and readily available. I am strongly inclined to start using Hydrogen in the future."

They are the same Smith part no.
Joe's right, you don't want to go directly off the tank and 20 psi through a reg would be on the top of the safe side. Gotta watch out for moleculer friction with H2.

Hi Bill,

Well, if it does, it'll be in VERY well aged beef! Just in case, suggest you savor your burgers carefully :=}.

Turns out that it probably landed in a sunflower field. AA0P, my son and I trekked thru the one directly below where we DF-triangulated the burst (pre-GPS days)- it was a psychic experience being in an 8-ft deep flower bed! Needless to say, no joy.

Hi Brek,

Yeah, I got my first taste of the impact of the programmed embedded controller on digital hardware design in the early 70's, when one of the most elegant digital designs that I've ever come up with got swallowed up about a year later by an 8008 :=\{.

So I take it that you're considering using the PicAxe in lieu of your 555/4017 design for a timed cutdown?

Hi Mark,

We are using a Victor SR450 regulator to fill out balloons with Helium. We typically see 80-100 PSI on the regulator guage while filling. It will empty a 210cuft tank in about 5 minutes. I think if we had a larger diameter hose we could fill even faster.

Louis
ANSR

>
> You won't get 100 PSI on the gage with the free end of the hose being wide open into the balloon, but the regulator internals have to be manufactured open enough to support a decent flow rate. A regulator for jewelers' work may not allow very many cubic ft per minute through the regulator body even if the valves are wide open. I expect that if the regulator only will supply 10-20 psi with a welding tip on, it won't let hydrogen out very fast with nothing on the end of the hose.

WOW!!!

we inflate ours very slowly,, an average fill time is 30 to 40 minutes..

YIKES 5 minutes!! I'm amazed it isn;'t one HUGE ice cube!

Joe,

The regulator gets mighty cold for sure. We filled one too many
balloons in 10-15 MPH winds and needed a faster fill.

3277. Helium / Hydrogen Regulator

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-12 01:47:08 UTC
From: Nicholas Stich
Topic: 3239 Message: 3277

There is a very simple and cost effective solution to converting to H2 from He or changing between the two gases as required.

McMaster-Carr is your friend and with the following two parts and some teflon tape you are in business for less than $10.

Part# 79215A666
Regulator Fitting Female Thread Inlet Nut, Cga #350, 0.950" Length
In stock at $3.47 Each

Part# 79215A667
Regulator Fitting Inlet Nipple, 1/4" NPT Male, Cga #350, 2.5" Length
In stock at $3.90 Each

And if you had a H2 regulator like I did they sell parts to let you convert it to He which has worked just great for me.

Hope to see you all at GPSL.

just make sure it's correct dimentions.

and left hand thrread to boot,, ansd the nut does little to nothing to seal the 3000#+ pressure.

I never even use a tool on mine,, finger tight is plenty and has never leaked yet.

3279. Re: [GPSL] the pic sounds good for the camera ???

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-12 05:13:18 UTC
From: Brek Brixius
Topic: 3236 Message: 3279

Hi Mike:

No, I am NOT planning to use the Picaxe on the cutdown for GPSL 2007. I am planning to use it on my cameras in place of the 555s there.

I got the Barro Switch that you sent today. Thank you very much for the loan. I got it worked into a cutdown unit. It weighs 7 oz. with battery and plenty of cord. I will still want to add some tape or glue to hold the lid closed. Say I add an oz. of tape, is a total of about 8 oz. too heavy to mount top of the parachute?

Right now, the cutdown hardware with the Barro Switch, Burner Coil and Battery is weighing about 4 oz. like you predicted. The foam package and cord though weigh another 3 oz.

BTW, the Barro Switch is pretty neat. I wish I could watch it expand in and close the switch though. :)

Thanks Again.

Mike Manes <manes@...> wrote:
Hi Brek,

Yeah, I got my first taste of the impact of the programmed embedded
controller on digital hardware design in the early 70's, when one of the
most elegant digital designs that I've ever come up with got swallowed
up about a year later by an 8008 :={.

So I take it that you're considering using the PicAxe in lieu of your
555/4017 design for a timed cutdown?

3280. Antenna for APRS

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-12 18:05:17 UTC
From: BASE
Topic: 3239 Message: 3280

Dear friends,

Please pardon/ignore this question, if you find it too simple.

First some brief background. We have been flying the system from StratoStar and have never flown APRS (five flights).

However, the idea of a back-up system using APRS, that is also accessible via APRS-IS to our partner K-12 schools has led us to enter the APRS domain using a Garmin 18 LVC and a Micro-Trak 300. As for the antenna, the web literature discusses Big Wheel, dipole, folded dipole, J-pole, ...

Now, the simple question: Which type of antenna do you use/prefer for your balloon borne APRS?

I'm interested in what has worked well (and hopefully survived) for you. Feel free to respond directly to me, if you prefer.

Thanks,
Howard

RE Helium / Hydrogen Regulator
Posted by: "Nicholas Stich" NStich@... nstich48

Nicholas has it right: swap out the CGA 580 inert gas nipple (and nut) for a CGA 350 flammable gas nipple and nut. His McMaster-Carr reference is great, and any welding shop worth the name will have these in stock.

I used to work at a place that had over a dozen different compressed gasses and we would swap CGA nipples all the time. The whole point of 'the one size fits only one' method is to prevent someone from feeding an oxidizer into a flammable gas system, or an inert gas into a breathing air system. There is no reason to get a whole new regulator for a different gas (with the exception of Oxygen, which requires a properly cleaned regulator). Just make sure to be careful to avoid gas confusion.

The best way to make the swap is to grip to regulator body in a vise, then use a 6 point box end 11/16" wrench or deep socket to unscrew the nipple. Do not use an open ended wrench, DO NOT use an adjustable wrench, and heaven help us if you'd consider doing this with vise-grips or pliars. A normal 12-point wrench or socket is the only acceptable alternative. Unchuck the regulator body, and be sure to clean the teflon tape residue from the reg high pressure inlet before screwing in your new nipple (wrapped with teflon tape). Use of the less appropriate tools will significantly degrade the CGA nipple in question.

Personally, though, I take advice from the Navy Ballooning manual, and do not use a regulator. With cautious opening of the gas valve, the initial flow is modest. After the gas path is established (plastic balloon fill tube verified to be flowing without constriction), we accelerate things a lot. On the ES-OS SEVEN flight (152 lb payload) we dumped a T-bottle (291 st cubic feet) every 30-40 seconds. As it turned out, a slower rate would have failed the mission as ten minutes after launch, a wind gust that certainly would have failed the balloon came out of no where. I was really glad we had filled fast and launched when we did.

Harry's caveat re "molecular friction" echoes one from one of our EOSS members, Mike N0MPM, who works at a local refinery. There are certain risks associated with the intense vortexes generated at a barely cracked valve on a high-pressure H2 bottle. Perhaps the H2 regulators are designed to mitigate that risk.

One other hazard with H2 is the possibility of static discharge from the flow friction, etc. Anyone know how to manage that one?

Hi Joe,

Lucky guy to have such a hangar with downwind doors. We'd need a door at least 20 ft high and 10 ft wide to move a 3000 gm with 35 lb neck lift out to the runway.

And then, of course, the wind's still there just outside the door ...

Space Data has a windy launch rig comprising a nylon bag, big enough to contain the inflated balloon, with a velcro tape seam running lengthwise along the top. Weighoff for fill includes the bag weight. When fill's complete, the balloonmeister simply unzips the velcro tape from the neck to the top, and bingo ... it's now up to the payload handlers to balance ascent rate vs. gravity :=}

Topic: 3236 Message: 3287

Hi Brek,

The baroswitch assy weighed in at 28 gm - about 1 oz - before I added the zip cord. And the burner with its thermal housing shouldn't be over about 50 gm max (2 oz). 19 ft of 500# nylon cord weighs about 1 oz. So I guess those batts come in about 3 oz. Not bad.

Now, you don't need a lot of thermal insulation around the whole cutdown assembly, since nothing in there's very temp sensitive (the batts do warm up FAST when loaded at 5+A). Just need enough to provide some mechanical protection; 0.38" foamcore would do the job fine.

Note that the EOSS baro-armed fast release with a backup release burner (no batts or relays, tho) comes in at 6.4 oz. The batts and relays are housed in a pouch inside the 'chute canopy about 2 ft down from the apex, so they're part of the parachute weight and don't contribute much to instability.

Bottom line: fly it! I think it'll do fine! Just be sure to secure the cutdown assy to the top of the chute so it'll be sure to come home.

You're not missing much watching the baro switch operate. Max displacement is only about 0.19" from the deck here in Denver to 10 mbar. Maybe someday you'll garner a vacuum pump and bell jar ... it took EOSS about 13 years!

3288. Re: [GPSL] Antenna for APRS

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-12 23:00:35 UTC
From: Mike Manes
Topic: 3239 Message: 3288

Hi Howard,

The "roll-up" 2m J-pole, similar to the MJF product, has served
EOSS well on multiple beacons running just 0.35 W xmit power.

We roll our own using just 1/4 wave of 300-ohm twin lead plus
1/2 wave of teflon hookup wire for the radiating element. And,
most importantly, RG-142 B/U coax for low-temp flexibility and
mechanical robustness. The antenna is strapped loosely to the
payload line to keep it near vertical in flight.

The wire J-pole provides about 5 dBi gain, has a verically polarized
omni pattern (good for DFing), is lightweight and robust, and most
importantly, unlike a 1/4 raditor, it generates very little "counterpoise
current" which can play havoc with the sensitive bits inside your
beacon package.

We use a 70cm Little Wheel for ATV, since we need all the gain we
can get. But it's heavy, and unless it's beefed up to tolerate a
parachute drag, it can demand a lot of preflight service to repair
broken solder joints.

I would feel comfortable with an aircraft refueling type 3-point ground!

Here's some thoughts on the static from Pete Sias...

... They also said that the hose should be braided and
grounded. Not able to find that and not wanting to pay
the price for that type of hose, I used standard
welders oxygen hose. The thinking or fear is that
friction of Hydrogen flow with start a fire. I keep
the flow low, < 10psi on the regulator output gauge.

I run a bare grounding wire from the tank (regulator)
to my filling nozzle / scale system. See my web page
on balloons... WWW.petesias.com

This is to provide a common point with no potential
difference between the balloon attachment point and
the tank. Also this wire is used to ground personnel
before touching the neck during tie off.

All of the balloons that the Severe Storms Lab in Norman, Ok launch into stornm updrafts are launched using a bag. They launch in the open in 30mph+ winds. They use a U-Haul truck that transports the filled balloon in the bag to the launch site.

3293. Re: [GPSL] Re: Helium Rationing now in effect in Kentucky

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-12 23:40:36 UTC
From: wb8elk@aol.com
Topic: 3239 Message: 3293

The folks at the Severe Storm lab sent me a photo of their velcro plastic balloon inflation bag (as I recall it was essentially a bag made out of bubble wrap in their original rendition with a velcro strip down the length of it)....I believe that was back in the early 90's when they sent me that photo.

Space Data does indeed inflate their balloon in the bag outside in high winds.

The bagged balloon method works well...but you have to carefully calculate the amount of helium you've pumped into it if you are inflating in a high wind since it'd be almost impossible to measure the lift in that situation....and yes, if you have a large van, panel truck or U-Haul...you can transport your balloon in the bag to your launch site in front of or inside the Twister.

I repacked it one last time. I got it down to 5 oz with some lighter foam. I hope it will fly well. I guess we will find out in a few days. I'm a lot happier with 5 oz. though. :)

Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Brek,

3295. GPSL 2007 T-shirts ready for ordering

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-13 04:41:28 UTC
From: Mark Conner
Topic: 3295 Message: 3295

The 2007 T-shirt is now ready for ordering at Zazzle. I made a minor change to the back of the shirt - the photo of the balloon has a blurred border so it's not so boxy-looking.

http://www.zazzle.com/mconner1/product/235793445906342262

You *must* customize the front of the shirt, otherwise it'll say "Your Name or Call Here". Just hit the "Customize this design" button, select the front view of the shirt, then click on the "Edit" button next to "Your Name or Call Here" and enter your name or call. Then pick your shirt size and add it to your cart.

If you don't want the "Premium" t-shirt, select another type. Polos, sweatshirts, and kids/ladies T's are also available. Selecting white is probably best for shirt color, but this design should print OK on gray and perhaps other light colors. The premium shirt has sharper graphics and better longevity than the regular shirts - my 2006 premium shirt is as good as the day I got it, while my 2005 "basic" shirt began to fade quite a bit after a few washings.

I will be placing an order for NSTAR members by June 22nd. If you have problems ordering, let me know at n9xtn@... and I can add your order to ours and bring the shirts to GPSL Friday morning (I won't be arriving until then). I would encourage other groups to order in bulk to save shipping - each shirt is about $6 to send individually, but goes down from there. Ordering shirts in quantity lowers the price too.

If you have questions or any difficulties with ordering, let me know.

I used a folded dipole, very easy to build and
survived several flights.

Now that we're only a few weeks away from GPSL 2007, I need a final head count for lunch on Friday. The hotel doesn't t need to know until a few days before hand, but I'd like to confirm as many as possible by the end of this weekend. It will be a buffet-style catered by the hotel and the cost is just under $12. Please respond even if you've already given me a count, that way I can confirm what I have and no one gets left out.

There will be two of us.

By the way, I have most of the welcome packets put together (I'm waiting for Nuts and Volts next week). Ralph's plaque will be done in about a week.

Thanks for hosting this year.

From: PAUL VERHAGE
Topic: 3308 Message: 3308

I've tested the design and am happy with it. It logs start temperature and pressure, time, temp, and pressure at the tropopause, and also at cutdown. The Terminator cuts down based on mission elapsed time, wind chill on descent, and increasing pressure. I'll email a copy of the code and a parts list when I get back from my teachers conference. I'll also bring several PCBs with me to GPSL.

There's room for another 80 or so bytes of data, so you can modify the code to record more frequently.

3309. Re: [GPSL] Antenna for APRS

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-17 15:47:58 UTC
From: Brek Brixius
Topic: 3239 Message: 3309

I am wondering if my antenna will work well enough. It's a 1/4 wave speaker wire dipole. The speaker wire is glued with hot glue into some pipe insulation to support the dipoles but yet remain flexible. I was actually planning to use two of these antenna. One for the cw beacon and one for the APRS. I have tested them in operation here on the ground and they work well. Will they work as well in the air?

I also have a roll up shirt pocket J-Pole but was not planning to fly it because I think the plastic would not stand the cold very well.

Brek - KC0YOE

Mike Manes <manes@...> wrote:
Hi Howard,

The "roll-up" 2m J-pole, similar to the MJF product, has served
EOSS well on multiple beacons running just 0.35 W xmit power.

We roll our own using just 1/4 wave of 300-ohm twin lead plus
1/2 wave of teflon hookup wire for the radiating element. And,
most importantly, RG-142 B/U coax for low-temp flexibility and
mechanical robustness. The antenna is strapped loosely to the
payload line to keep it near vertical in flight.

The wire J-pole provides about 5 dBi gain, has a verically polarized
omni pattern (good for DFing), is lightweight and robust, and most
importantly, unlike a 1/4 raditor, it generates very little "counterpoise
current" which can play havoc with the sensitive bits inside your
beacon package.

We use a 70cm Little Wheel for ATV, since we need all the gain we
can get. But it's heavy, and unless it's beefed up to tolerate a
parachute drag, it can demand a lot of preflight service to repair
broken solder joints.

Hi Brek,

So far I have used the same dipoles on 21 flights and have had real good performance out of them. I use speaker wire and RC car antenna tubing for the support for the hot radial. I leave the ground radial hanging down loose with no support.

I'm placing the order for Helium this week to ensure timely delivery of the T-size cylinders.
Attached is the list of folks that I've received payment from, and the size and quantity of the order.
If you see any discrepancies, please let me know before Tuesday, June 19.
I'll try and have one or two spares on hand, but the handling of this quantity of cylinders is going to be a little difficult, due to DOT regulations we're restricted on carrying more than 1000 lbs. without a CDL.
I have three vehicles lined up to accomplish this task. Any more cylinders and we may be "log rolling" them half way across GI.

Looking forward to seeing many of you again and meeting all of the newcomers. I'll do my best to keep the website up to date with the latest details. Check back often.

Roger,

I sent you a pic.

I forgot to mention that I cut the elements long then trim them for SWR after I have it mounted on the capsule. The reflective coating on the capsule affects the SWR. My radials end up being about 19 3/4" for 2m.

I don't think any digipeaters are planned to be on 144.34, though some stations should perform I-gate services. So the path for balloon APRS beacons won't really matter - nobody is likely to digipeat you anyway.

I would leave the path off to shorten the packet a few bytes.

From: Ralph Wallio, W0RPK
Topic: 3323 Message: 3324

From packet header data it appears the two packets from N9XTN-8 and single packet from KC0MWM-2 were
routed to KC0LNO in Monument CO via TCPIP (the Internet), not via CNNSP>EOSS.

Four packets from AB0XK in Russell KS were digipeated by AE0SS-11. There is no evidence they were
digipeated by CNNSP or any other station.

If this is all the evidence we have it appears EBBE did not happen in either direction.

N9XTN-8 and W0RPK saw packets digipeated by CNNSP from each other (EBE).

Subject: [GPSL] Log from EOSS Flt on Sat.

Looking through my log I found the following packets from outside Colorado.

08:34:46 N9XTN-8>APS224,TCPIP,KC0LNO*:=4117.34N/09619.91W-QTH WaterlooNE
EBBE attempt
08:34:46 N9XTN-8>APS224,TCPIP,KC0LNO*::AE0SS :test EBBE msg{2W}
08:58:05 KC0MWM-2>APU25N,TCPIP,KC0LNO*::AE0SS :****** Hello Colorado
********{65
09:02:19 AB0XK>APU25N,AE0SS-11*:=3854.11N/09851.70W-EM08NV
09:04:32 AB0XK>APU25N,AE0SS-11*:=3854.11N/09851.70W-EM08NV
09:10:22 AB0XK>APU25N,AE0SS-11*,CNNSP:=3854.11N/09851.70W-Hello from the
heartland!
09:13:17 AB0XK>APU25N,AE0SS-11*::K0ANI :Hi from the middle of Kansas!{94

The times are the receive time at the ground station. At 08:34 our balloon
was at about 53,000 feet and at 09:13 at about 86,000 ft.

Did you all see any of the packets Mike W5VSI and I sent from AE0SS?

Hi Brek,

I assume you mean a 1/2 wave dipole (2x 1/4 wave radiators in opposite directions).

Yes, it will work as well in flight as on the deck. However:

1) it does put the max radiated H field right near your payload electronics. If your payload xmissions aren't distorted or reading wrong analog values, then this may not be a issue.

2) I also assume it's a vertical dipole to permit accurate DFing. In that case, then the upper section my get bent or broken off during a parachute drag.

Been both places, got both T-shirts. This is why we do homebrew J-poles.

Better to make your path just APRS. AE0SS-11 is configured as as WIDE,
and I dare not mess with something that took so many hours to get right!

Hi Nick,

It looks like Mark's and Rog's beacons that had TCPIP in the path got
to our I-gate, KC0LNO, by means other than Pure-D raddio :={.

AB0XK hit AE0SS-11 direct from KS w/o EBBE thru CNNSP. Woulda been
nice to have made an ARQ thru BALNOD, though.

So, once again, ad hoc EBBE QSOs remain elusive (for MOST of us, Harry!).

Considering how packed 144.34 is with slotted beacons, I'd recommend
avoiding use of digipeaters, whose frames are not slotted. However,
it would be nice to have some I-gates set up in advance so that absentee
members of the groups flying at GPSL can enjoy the trip vicariously.

Mike, I tried to get to EOSS via CNNSP, but by the time I started hearing parts of a CNNSP packet EOSS was on the way down. I threw out a couple packets just before CNNSP burst, just for luck. No Joy! :(

Hi Stephanie! There won't be any Digi's on 144.340 at GPSL, but with EOSS configured as a WIDE, any WIDE Path would go through them so I will make ORB's path APRS. I might suggest also that any mobiles that will be on .340 take WIDE out of their paths. I shut my beacon off in the mobile, but to be safe I will remove it's path.

There will be two of us.

By the way, I have most of the welcome packets put together (I'm waiting for Nuts and Volts next week). Ralph's plaque will be done in about a week.

Thanks for hosting this year.

Paul

>>> "Roger Hammond" <rahammond@charter. <mailto:rahammond%40charter.net> net> 06/14/07 4:21 PM >>>
Now that we're only a few weeks away from GPSL 2007, I need a final head count for lunch on Friday. The hotel doesn't t need to know until a few days
before hand, but I'd like to confirm as many as possible by the end of this
weekend. It will be a buffet-style catered by the hotel and the cost is just
under $12. Please respond even if you've already given me a count, that way
I can confirm what I have and no one gets left out.

How do you calculate the descent rate? and How do you know which package will fall faster without drop testing? I will have two modules on the BUNS balloon. One is cameras and the other is APRS / Beacon. The cameras are slightly heavier and have a slightly smaller earthward footprint. I'm thinking the cameras should on the bottom then.
Is that right?

Now that we're only a few weeks away from GPSL 2007, I need a final head

count for lunch on Friday. The hotel doesn't t need to know until a few days
before hand, but I'd like to confirm as many as possible by the end of this
weekend. It will be a buffet-style catered by the hotel and the cost is just
under $12. Please respond even if you've already given me a count, that way
I can confirm what I have and no one gets left out.

That's good thinking. The more it looks like a low-drag bomb, the
faster it'll fall (generally speaking, assuming similar density, etc, etc).
The payload that's more like an empty shoebox oughta go close to the 'chute.

3340. GPSL shirt orders

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-22 17:03:34 UTC
From: Mark Conner
Topic: 3340 Message: 3340

Just a reminder - if you plan to order a 2007 GPSL shirt, you should place your order in the next few days to ensure delivery before you depart for Grand Island. Designs for the previous years are also available if you would like them.

2007 shirt:
http://www.zazzle.com/mconner1/product/235793445906342262

Other shirts:
http://www.zazzle.com/mconner1

I will be submitting an order for NSTAR members plus a couple of others who have requested them. If you don't want to deal with the ordering, send me an e-mail with size and callsign/name information and I'll order the shirts and bring them to GPSL Friday morning. Cost is around $20 for sizes up to XL, about $4 more for 2XL+.

From: Hank
Topic: 3341 Message: 3341

I think this will be worth watching.

The human interest story that is on every Friday as the last piece this week will be about a guy that flies by means of a harness suspended beneath a large cluster of fairly small helium balloons. This is untethered balloon flight!

Broadcast time varies by individual station and time zone, but typically in the east it begins at 6:30 PM. The balloon story, being last, will be on somewhere around 6:52 PM.

Hank

Regarding the video though......why in the heck would they pop all
those balloons after he landed after just a single flight???

I'd blow up a few more, tie them in and take another spin
around...and so on and so on.

If the helium is so expensive, he could also hitch someone else on
and send them off....and not waste the helium for just one ride.

Or, recover the helium by pumping it back into the tanks for the balloons.

Enjoy.

Hi Bill,

Yeah ... I'd forgotten that you'd taken a hop in that rig. Wotta kick!
"Lawnchair Larry" redux.

Seem to recall that altitude is controlled by either ballast dump or
cutting lift lines. Sure beats the BB gun that Larry forgot to tether.

And it must take a truckload of He get that much lift ... goes beyond
my pocket change :={.

3354. Long-range look for GPSL weather

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-25 15:33:30 UTC
From: mconner1@gmail.com
Topic: 3354 Message: 3354

It appears things are stabilizing into the usual early July pattern, with a strong ridge over the western US and a trough in eastern Canada. Most of the forecasts indicate the ridge will be strong enough to put us in dry, weak northwesterly flow aloft. The main thing is that there are no instances of strong surface winds noted for the few days before or after July 7. In late May and early June we had a large number of days with strong southerly winds that would have made it impossible to launch outdoors. Our main worry will be thunderstorms but from the overall pattern it appears we will have a less-than-average chance of them late next week.

The upshot is that we should have good conditions for flying at GPSL on our scheduled day, as we have for all of our previous six Super Launches. Temps should be close to normal with morning lows around 70 and highs in the low 90s.

3359. GPSL 2007 meals...

Yahoo group: GPSL (2002 — 2008)
Date: 2007-06-26 22:29:52 UTC
From: Roger Hammond
Topic: 3359 Message: 3359

The Thursday evening meal at El Tapatio's should be good to go. I'm estimating 25-30 people for that meal. I was following up with Valentino's, the restaurant for Friday evening's meal, and apparently the party room is unavailable. They said they would do their best to accommodate a group of ~50 that evening in the main dining room and attempt to seat us together.

I'd like to know what people think about lunch on Saturday. With our get-together session at the HoJo after recovery, I was considering just letting the groups find some lunch on their own, attend the afternoon session, and then everyone getting together on Saturday evening...I'm considering The Wonderful Garden Chinese restaurant. They do a buffet, or you can order off the menu, it's close to the HoJo and can accommodate a fairly large group.

Let me know if anyone is opposed to the idea of finding lunch on their own on Saturday. I'd be happy to make suggestions and give directions.

From: Patterson, David
Topic: 3359 Message: 3361

TU has added another to our party, bringing our total to 5.

Given how things went last year, I'd venture that an ad hoc coordination for lunch on Sat is a great idea (and more fun, anyway)!

Thanks!

Subject: [GPSL] GPSL 2007 meals...

The Thursday evening meal at El Tapatio's should be good to go. I'm estimating 25-30 people for that meal. I was following up with Valentino's, the restaurant for Friday evening's meal, and apparently the party room is unavailable. They said they would do their best to accommodate a group of ~50 that evening in the main dining room and attempt to seat us together.

I'd like to know what people think about lunch on Saturday. With our get-together session at the HoJo after recovery, I was considering just letting the groups find some lunch on their own, attend the afternoon session, and then everyone getting together on Saturday evening...I'm considering The Wonderful Garden Chinese restaurant. They do a buffet, or you can order off the menu, it's close to the HoJo and can accommodate a fairly large group.

Let me know if anyone is opposed to the idea of finding lunch on their own on Saturday. I'd be happy to make suggestions and give directions.

Dear Roger,

BASE will only have 6 people, which should match the
recent gain by Taylor. We won't be there in time for
Thursday dinner. With our slow ascent plans (we just
did a 450 ft/min climb on our flight this morning),
I'm sure we'd be late for any group lunch. The
Saturday evening dinner plans are fine with us.

Thanks for all of your efforts,
Howard

I would be in favor of lunch on your own since we're planning an afternoon get-together and an evening meal. That way we won't have the usual issue of some recoveries taking longer than others and having our lunch stretch over four hours at some restaurant.

I'll need to be back in Omaha before it gets too late, so I don't know if I'll be staying for the meal Saturday night or not. Unless our recovery goes poorly, we will head back to Grand Island for the afternoon post-mortem.

Roger,

Could we get a preselected list of area repeaters we could use? Probably will need one for within Grand Island itself for pre/post flight activities, plus some others in the probable recovery areas. At the moment, it appears our flights will head SE or SSE perhaps up to 60 miles (east or southeast of Hastings).

Things continue to look favorable for flying Saturday the 7th, with a benign pattern surface and aloft. Winds should be nearly calm early in the morning underneath a weak inversion, so an early launch (before 8am or so) would be better.

Earlier this week, the wind fields showed a northwest wind at about 50 knots between 30,000 and 50,000 ft, yielding landing sites about 40-60 miles SSE of the launch site. However, the last couple of forecasts show some weakness in that flow passing overhead Saturday morning, shortening the tracks to about 20 miles and making the direction much more variable. The latest puts the landing about 10 miles NW of Hastings (about 210-200 deg from launch site).

Being new to HAB I am curious as to weather / wind predictions favorable to high altitude flights. Having a general understanding of weather associated with highs and lows, the Coriolis effect, iso-bars, etc., I am at a loss as to what approaching weather typically does to winds at the surface and winds aloft.

Can anyone give me some pointers (web or otherwise) for what to look for weather-wise in the days prior to a flight - particularly wind?

If it matters I live in northeast Iowa and am hoping to launch my first HAB this Fall (after that evil corn is harvested!).

Thanks,

Pete

Hi Pete,

Those isobars 'n stuff that affect our surface (tropospheric) weather cant be relied on for stratospheric predictions. For one, the stratosphere is very dry, so there are essentially no clouds. And the winds are generally lighter (except for the jet stream, which hangs out near the tropopause) and are affected primarily by N polar solar flux.

I've attached a pix of the typical winds vs. alt at 40N thruout the year. The Y-axis is westing wind speed (+ = from the west, - = from the east), and the X-axis is the month. So at low altitude, trajectories are generally to the east, as are winter upper winds. But the summer upper air moves to the west, which can make for pretty short launch-to-land trajectories - and even landings W of the launch site.

If you fly in the fall, you may encounter upper air "turnaround", where winds are near calm.

There's a full set of N lats pix on www.eoss.org.

Harry,

Close to the power plant here...you could easily wade part way out without the current knocking you over. The farmers have started to irrigate in full force, so that will pull it down quickly. I'd stick with Mark's suggestion...."don't land in the river".

:-)

Harry,

We've had a wetter than normal spring, so the mosquitoes have had plenty of places to hatch. They don't normally come out in full force until dusk.
Two weeks ago when we were recovering CNNSP_08, my wife ended up with a tick that needed to be tweezed when we got home. She was out of the Jeep for about 10 minutes and didn't even get in the tall grass, but then she has that kind of luck.

I did some measuring of the large parking lot at the Webb Road Sports Field this afternoon. The lot is about 150' wide east-west and probably 0.2 mile long north-south. We'll plan on occupying the 300' long area towards the middle of the lot in between the two sets of bleachers with awnings above them. This should let any spectators enter from either end, (there's an entrance gate on each end of the field), and not have to drive past or through any group's designated area. I wanted to overlay this on a Google satellite image, but unfortunately the clouds have that nicely obscured. Imagine the attached image is about 150' top to bottom and 300' across. I'm thinking that parking towards the outside edges and filling towards the middle might be the best solution. I'll have labels on the helium bottles and hopefully have them close to your area as a marker on Saturday morning. Let me know if these positions won't work for anyone.

3396. Final head count for Friday Conference Lunch

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-01 03:26:49 UTC
From: Roger Hammond
Topic: 3396 Message: 3396

Sorry to sound like a broken record, but here's a list of groups or individuals that have committed to eating the lunch buffet. I'll email the final list on Monday, so anyone not accounted for will have to find lunch on your own. During registration each individual or group can purchase their meal tickets for $11.50 per person. This includes beverage, meal, tax, and gratuity. Arlene KCØZWX will have the meal tickets at the registration table along with the list of groups / individuals that I received from all of you via email. If you're not part of the totals below, I need to know NOW.

Here 'tis....

5 - Taylor University
2 - K0NMS
12 - EOSS
1 - ORB
2 - BUNS
2 - NSTAR
8 - NSV
2 - WB8ELK
6 - BASE
2 - NearSys
2 - KC0MWM
1 - WY0F
1 - K0JLR
1 - WB0PKP

Being new to HAB I am curious as to weather / wind predictions favorable to high altitude flights.

>>>>>>Pete:
The surface winds at launch are by far the most important factor as they can destroy a partially filled balloon before it can be launched. Strong shears at altitude have been said to tear apart big plastic bag balloons, I'm not sure that any premature failures of the near-spherical latex balloons have been linked to that. Regardless of macroscopic surface winds situation, a good fill and launch can often be made out of a natural depression, a tree-lined field, canyon if the surface winds are across and not down the canyon. Hot air balloon pilots call these sort of launch sites 'sucker holes,' as the inexperienced hot air balloon pilots will launch with an unwarranted sense of confidence in the impending flight. I recommend use of toy latex balloons as pilot balloons or 'pi-balls' to visualize the ascent trajectory. If the pi-ball hits a powerline or structure, that's a good indication that the larger balloon with payloads will, too.

Thanks to all that have responded to my HAB weather query. Some good information and suggestions.

Just when ya think you're getting a handle on weather you figger out you've got another 95,000' feet more to learn. 8-) Experimenting and learning is what this is about, though. Oh, and having fun doing!

Another question I've not seen answered anywhere and that's about the gas used. It seems that most HABists use helium and not hydrogen. I understand there is a safety concern using a flammable gas. Never having even witnessed a balloon fill in my mind it seems that filling outdoors could be done safely with hydrogen. The gas would be too rich to burn in the balloon envelope and too lean not too far away (up). I certainly don't mean to start something contentious here and maybe this isn't the correct forum. If so, please correct and direct me away from this.

3403. Weather update for Saturday

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-02 14:42:30 UTC
From: mconner1@gmail.com
Topic: 3403 Message: 3403

Still looks good. The biggest concern I have is surface winds, but should be nearly calm at dawn and only up to 10 mph from the southwest by 9am. There is some trend for stronger winds with each forecast, but I don't think it'll get out of hand. Earlier is still better for a launch time.

The track and upper-level wind forecast will be hard to pin down. Over the weekend, the forecasts put the 30-40 kft winds out of the north at about 30 knots. Now they are from the ENE at 15-20 knots, resulting in a landing about 20 mi WSW of the launch site. We could end up underneath a weak upper level low, which would make the track short but in almost any direction.

Dear friends,

If you want to see an aerial view of the launch site,
you can input the address (1212 S. Webb Road) into
www.mapquest.com and click on aerial image. The image
quality is not as good as maps.google.com, but is
adequate for seeing the fields, parking lot, and
entrances.

I look forward to meeting you all on Friday,
Howard

Had to laugh at the first one as it states "Nominal altitude is 113.5 ft.".

However, the chart shows that it should be 113.5 thousand feet.

Date: 2007-07-04 13:44:56 UTC
From: mconner1@gmail.com
Topic: 3411 Message: 3411

Wow, just three days to go before the flights....

The track forecasts have been pretty consistent in putting the landings west or northwest of Hastings. The 06Z GFS forecast has the landing about 12 miles west of Hastings (210 deg at 27 miles from launch).

No major changes in the surface wind forecast. Still expecting an inversion to help keep the winds quiet in the morning (south at less than 5 mph) and it should hold to about 9am. After that, winds will increase to about 10-15 mph. Temps at launch time should be in the low 70s and reach the mid 90s by afternoon. It will be somewhat humid as well. Skies should be mostly clear.

I just used Near Space Ventures online balloon track and come up with a predict East of Hastings for launch at Webb Road with ascent rate of 1082 fpm, Burst at 80k (my planned cut away) and descent of 800 fpm. I'm using GRI as the weather station and the 0-84 GFS model. I'm figuring a launch time of 8:00 a.m. since Mike said we were launching the EOSS bird first. Am I doing something wrong?

I just ran the last predicts from my home qth where I ☐think☐ I know what I☐m doing. Those predictions are posted here:

http://www.eoss.org/flight/prediction.htm

I reinstituted the prediction history page. It has all the predictions I☐ve made for the past week or so. You can easily find it on the menu on the page above. It☐s not too encouraging as the winds are pretty unstable but the distance has been pretty constant. Hmmm, reminds me of some forecaster making that comment a few messages back.

Just for kicks I ran a prediction for Friday landing, east of Hastings. Maybe you slipped a digit when selecting the wind data? Who knows, well Mark knows but who else?

CU guys later today. Now for a quick 4 hours of sleep.

Subject: Re: [GPSL] www.superlaunch.org website updated

I just used Near Space Ventures online balloon track and come up with a predict East of Hastings for launch at Webb Road with ascent rate of 1082 fpm, Burst at 80k (my planned cut away) and descent of 800 fpm. I'm using GRI as the weather station and the 0-84 GFS model. I'm figuring a launch time of 8:00 a.m. since Mike said we were launching the EOSS bird first. Am I doing something wrong?

Brek - KC0YOE

Roger Hammond <rahammond@...> wrote:

As Mark previously stated the track forecasts are remaining fairly consistent in putting the landings west or northwest of Hastings and this might push us to our auxiliary launch site at Wood River High School.

I've updated the website www.superlaunch.org <http://www.superlaunch.org/> and placed the launch position for each group on an image, thanks to Mark N9XTN and Google Maps.

Thursday afternoon I'll be monitoring the local club repeater 146.94- (Tone 123.0) if anyone needs to be in touch with me.

3418. GPSL forecast update

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-05 14:37:05 UTC
From: mconner1@gmail.com
Topic: 3418 Message: 3418

The surface winds could start to become a factor. The forecast soundings show 30 knots at about 1500' AGL for Saturday morning, but still 5-8 knots from the southwest at the surface for 7am. By 10am the winds increase to 10-15 knots.

This will place a premium on our time early Saturday, as stragglers will have to contend with more wind for the fill and launch process. The schedule is currently showing a 7:30am launch, but experience shows that we are rarely ready by the scheduled time. We may end up launching like we did for GPSL 2005, where the balloons are released whenever the crew feels the wind is putting them at risk too much. A simultaneous release is very exciting to watch, but it depends on everyone being ready in a reasonable time.

Our forecast track also poses some challeges. Using the online Balloon Track I get a track of 225 degrees at 29 miles, which puts the landing about 3 miles northeast of Heartwell. However, this forecast includes some winds above 60,000 ft that are a little suspect. Using some adjusted numbers puts the landing much closer to I-80 and the Platte River near the Shelton exit. If we use this forecast but move the launch to Wood River, that's just a different landing place still near I-80 and the river.

If this holds we may need a launch site south of I-80, which Roger is investigating (possibly near Hastings).

Still expecting sunny, hot, humid weather with afternoon highs in the mid-90s. Also be aware that many of the landing sites will be covered by 8-foot-plus irrigated corn.

3419. Flight Callsigns

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-05 15:30:37 UTC
From: Doug Eubanks
Topic: 3419 Message: 3419

I hope you all have a good time at the launch this year, I unfortunately work weekends now and don't get to participate in normal weekend fun without taking vacation days and getting someone to cover for me is a real headache.

So, with that in mind, would someone please post the payload callsigns so those of us not present can track via findu. I can access that from work and have learned the trick to tracking multiple stations through findu. Would like to see how well it really works. Post them Friday sometime please, I leave for work early Saturday morning and wouldn't get them if posted as you leave/arrive at the launch site.

3423. another launch site if needed....

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-05 22:39:18 UTC
From: Roger Hammond
Topic: 3423 Message: 3423

If it becomes necessary to launch south I-80, we have permission to use the trap shooting club's facility parking which is north of Doniphan, NE. Doniphan is south of Grand Island on Hwy 281. The trap shooting range is on the north edge of Doniphan. I don't believe its paved but there are gravel access roads and plenty of short green weeds. I was out there this morning and it looks like they have connections for RV's along with parking...I'm assuming for large competition shoots. This is the best I could do on short notice.

Let's see what tomorrow brings.

3428. Probable change in launch site

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-06 18:21:21 UTC
From: Mark Conner
Topic: 3428 Message: 3428

For those of you watching GPSL vicariously, we will probably change the launch site to Doniphan, NE. On the north edge of town is a trap/skeet range where we have permission to fly from.

This puts the landings about 10-14 miles west of Hastings, a bit south of Hwy 6. Otherwise we'll end up too close to the Platte and I-80 if we were to use Wood River or the Webb sports complex in GI.

Final decision will be made later this afternoon, probably by 5pm CDT.

73 de Mark N9XTN

3429. GPSL launch site - Doniphan NE at 0700 CDT

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-07 00:25:57 UTC
From: Mark Conner
Topic: 3429 Message: 3429

We have officially moved the launch site to the north side of Doniphan. Also, launch crews will be arriving at 6am CDT for a (hopefully) 7am CDT launch time. This is a bit earlier in the hopes of catching lighter surface winds closer to dawn.

For a 93,000 ft burst, 1000 ft ascent, and 1000 ft descent, the landing is predicted to be a mile or so south of Heartwell.

NSTAR inched out the top dog with a burst around 110689 at ~9:04. If I
were NSV, I'd be asking to see Mark's metric conversion factors.. ;-)

EOSS burst at 90849 at 8:26 this morning.

KC0YOE burst around 78368 at 8:31am.

K0NMS-11 burst at 89525 at 9:23am.

Landing zones are now extending out further west - nearly 40mi W-SW of
Hastings. W0NSV has been carried off the farthest so far.

We did not see this report during the chase, so we thought we may not have gotten ahead of NSV. We did have a visual sighting of the burst, though.

I checked our metric math during prototyping - it's within 3 ft up to >200 kft.

This record was on our second balloon of the day. The first 1200g balloon left early when the load line broke. I decided to risk our 2000g balloon even though the winds were coming up - what would be the odds of losing another balloon? :)

Sorry we couldn't stay for the post-flight festivities, but both of us were too sleep-deprived to stay to the evening and still drive back.

Angie and I are delighted with the results of our first flight (BUNS-1). I have tons of pictures to process and the Barro Switch cutdown gave us a clean separation very near our target of 80,000 ft.

We were able to track our modules all the way to the ground on APRS and then pick it out of the corn field by homing in on the CW beacon.

We didn't set any altitude records or take the clearest pictures that have ever been taken in ARHAB but we did satisfy our objectives and had a really great time in the process.

It was wonderful to put some faces with the names we have seen here in the yahoo GPSL group. It was also great to see what other groups were doing with their projects and then be able to see how things came out at the post flight gathering.

Thanks everyone! We couldn't have done it without you.

From: Mark Conner
Topic: 3439 Message: 3439

Would each group provide a quick summary of how their flight went, or a link to their flight's page when it's updated?

For NSTAR we had a pretty nominal flight. We switched frequencies on our main payload prior to launch because my time slotting was a bit off and was hammering ORB's slot. Fortunately the same slot was available on 144.36 instead. The simplex repeater stopped functioning after burst and the radio for it was powered off when it was recovered. It was not well packed because it was a last-minute addition, so it may have hit the power switch or the internal battery may have been jostled so hard that it opened its spring contacts (it's happened before).

We shot 365 pictures during the flight, but the percentage of good ones was pretty low. Our Concord camera seems to be degrading over time (it's three years old). Given my experience with cheap (<$50) digital cameras, I've about decided that I'll need to spend about $75-100 for a decent one. I'm looking for one that's in the 4Mpixel+ range, no optical zoom, and hopefully easy to modify.

Great presentation, Bill! Sorry you weren't able to join us at the launch - Roger picked a GREAT alternative site on short notice. Great conference to boot. BZ to Roger for having done a bang-up job making the biggest ever GPSL a rousing success!

EOSS-119 did get off, despite its abysmally incompetent 3rd string balloonmeister's demonstration of terminal clumsiness. We worked 2 stations out of Russel KS 59 on the crossband repeater, hit about 91K' and recovered from yet another corn field, despite the obstinate refusal of EOSS's Chieftain of Corn Recovery's refusal to grace us with his inestimable experience. There was some whitening of knuckles as the descending payload string casually drifted down about 200 yards from some 500 KV power lines. Farmer John was delighted with opportunity to depart from his daily routine to carry Steve 'SCC out to the landing site on his ATV, where we once again retained our tenuous grasp on our 100% recovery rate.

Glad to hear that you've rounded up some folks to help you celebrate your 20th anniversary flight, and hope that your pitch will pull in a few more. Sorry to say that all of EOSS's kitchen passes for out-of-state flights got spend this last weekend.

Hey Brek,

It was great meeting you and Angie, and congratulations on a picture-perfect first flight and recovery! A lot of us went thru the same kind of tribulations early on that Bill Brown unabashedly disclosed in his presentation on Friday afternoon.

BTW, could you post a link to some of the photos your payloads shot?

Hope you had a pleasant trip back to Chadron, and good luck with continued successful flights!

But I'm sure that you'll do just fine on BUNS-2, -3, -4 ...

3446. Pictures from BUNS-1

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-09 05:28:42 UTC
From: Brek Brixius
Topic: 3446 Message: 3446

I have created an album in the yahoo GPSL group and posted a few of the pictures we took.

I think all members of the group should be able to access the pictures. If not, let me know.

Most of the ones I posted are from the camera carried on EOSS-119. That camera was a 1.3 megapixel digital mounted upside down (intentionally to allow easy access to the SD card). Most of the pictures look very light (sort of overexposed). I am going through and cherry picking some shots, rotating them back to right side up and adjusting the color as best I can.

There is also one picture from the 3.1 megapixel camera carried on BUNS-1.

They probably won't win any awards but they do give an idea what it looks like from the flights.

I hope folks enjoy them.

3447. K0NMS-11 Summary

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-09 11:52:42 UTC
From: Nicholas Stich
Topic: 3446 Message: 3447

This is based on the data from Rino memory....

Distance Balloon Traveled = 68.2 miles
Time of Flight (aloft) = 3 hrs 20 min
Average Speed of Balloon = 21 mph
Maximum Altitude (by Rino) = 89,727 ft
Time to Max Altitude = 2 hrs 39 min
Avg. Rate of Ascent = 552 fpm
Time of Descent = 41 min
Avg. Rate of Descent = 2134 fpm

Maximum Speed on Ascent = 48mph at 3,717 feet
Maximum Speed on Descent = 37 mph at 41,877 feet

We had an ascent rate of right at 1,000 fpm to about 14,000 ft and
then it dropped to 450 fpm and stayed flat till burst.

The K0NMS Group wants to express our thanks for a great job that was
done by Roger and CNNSP.

THANK YOU !!

Later - Nick

From: BASE
Topic: 3439 Message: 3448

BASE 8 was a very good flight. The preliminary data analysis presented by the students indicates that we were successful. Some of the basic information is on our website at:

http://www.depauw.edu/acad/physics/base/pages/base8.asp

Let me apologize to all for not having APRS for the flight. Thanks to the door prizes, I should have two units available for the next GPSL. We did not intend to fly incognito.

The launch was hampered by an inconsistent control pod, and our average ascent rate of 810 ft/min was twice our target. We did reach a new record elevation above sea level for BASE - 97,700 feet.

The flaky brain stopped sending GPS data at 28,000 feet , but we still had good solar cell data and confirmed the landing at 14:50 UTC.

We located the system using the advice of Mark Conner from Friday's briefing that the landing point would be at the location directly below where the balloon was at 30,000 foot on descent AND a little bit of directional finding with our ground based (mobile for this flight) radio.

The 2007 GPSL was a wonderful event, and we look forward to working with you (and tracking together) as the years go by.

Thanks again to all for the assistance.

Howard

P.S. - We are planning to fly on Wednesday or Thursday, after the storms roll through here.

3449. GPSL ORB Recap

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-09 18:31:43 UTC
From: Harry M
Topic: 3449 Message: 3449

GPSL-2007 was a huge success!
Thanks to Roger & CNNSP for a great job putting it together!

I left Tulsa at 6 am Thursday and arrived in Grand Island at at 1 pm. Thursday night those of us who were in town met and had dinner. The Saturday seminars were very informative and there were 50-60 in attendance. Friday night we all met for dinner and the rest of the night was spent running predictions and prepping equipment for the flight. Surface winds were predicted to be in excess of 10 mph Saturday morning so Roger had scoped out a launch site in Doniphan about 10 miles south of Grand Prairie. This proved to be an excellent site.

Saturday morning I arrived at the launch site at 5 am. Thanks to Professor Flaten I had the help of two University of Minnesota students, Karla & John. We launched ORB-22 at 06:58. Another University of Minnesota student, Derik, volunteered to be my driver on the chase with Professor Flaten and the rest of the students chasing in their car. Derik & I took up a position about 8 miles west of Hastings on Hwy-6 where the Taylor University tracking team also happened to be. ORB-22 burst at 08:05 @ approx. 79,000 feet. We spotted it at 3,000 feet on the descent and it landed about 1,000 feet from us in a bean field at 08:31. We obtained permission to enter the field and ORB-22 was recovered about 30 minutes after landing. The horizontal camera was set in lo-res mode (640x480) because of an internal problem and took 57 pics on a 2 minute interval. The vertical camera was set in hi-res mode (1248x960) and captured 26 pics on a 4.5 minute interval.

ORB-22 landed 10 miles NE of the EOSS landing site so I went there to see if I could be of any assistance. They were waiting for the land owner and one of their group to return from the field with their payloads. On a recommendation from the land owner we ate lunch in Hastings at the Bullseye's Sports Grill, then headed back to Grand Island.

The EOSS group and myself spent over an hour trying to DF the EOSRED balloon which failed to send position data right after launch. As it turned out what we were DFing was their car with a balloon icon. We disengaged and returned to the motel.

This year it was decided to have a post flight meeting which was a great idea. Flight overviews were presented by each group. Saturday evening we all gathered for dinner and a good time of socializing was had by all.

Sunday morning I left for Tulsa at 7 am and arrived home 2 pm.

I enjoyed visiting with old friends and meeting new ones.
Thanks to all who were there and a big thanks to Roger and CNNSP for making it happen!

An observation that Roger and I talked about was that there was a real sense of camaraderie this year, more so than in the past. Everyone seemed to be very at ease. I think that as each year passes we have developed a friendship that shows more and more and it is very contagious. Individuals and groups that attend for the first time see this and immediately feel like they are a part of it. A seed was planted and has grown into a beautiful gathering. I hope this continues for decades to come. Thanks to all of you for nurturing the seed! God Bless!

Looking forward to GPSL 2008!

73 Harry KC5TRB

Here is the beacon with the official ORB-21 landing coordinates...
KC5TRB-11>APT310,APRS:/133129h4033.87N/09837.57WO115/000/A=002024

I will be uploading a short video of the ORB-22 landing.
It will be in the ORB Yahoo Group "FILES" section.

Subject: SDG-5 is aloft

Soli Deo Gloria Five, an experimental superpressure balloon, is aloft now. The balloon is carrying a CW beacon on 28.636.

Details on the beacon from Pierre Thomson, KA2QPG:

The payload package includes:

* An 8-bit microcontroller (PIC 16C715)
* A barometric altimeter (MPX100A/TL072)
* An outside temperature sensor (DS1721S)
* Battery voltage monitor
* CW Beacon on 28.636 MHz (crystal oscillator)
* Vertically polarized 10m dipole antenna
* Eight AA Li-Fe batteries for 12V @ 2500 mAh

Telemetry frame format (sent every 2 minutes on 28.636 MHz) :

DE KA2QPG BLN M 1434 A 033 T N55 B 8R7V EMAIL PT AT RIFTON.COM AR

where:
M = mission elapsed time in hours and minutes
A = altimeter (absolute pressure [higher # = lower alt], 0 - 255)
T = outside temperature (00 - 99 degrees C, N = negative)
B = battery voltage (0.0 - 9.9 volts)

The remaining time in the 2-minute cycle will have a Morse "dit" every 4 seconds.

3452. KC5TRB 144.340 Log File

Yahoo group: GPSL (2002 — 2008)

3453. Canon Powershot A300/A310 comments?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-09 22:11:39 UTC
From: mconner1@gmail.com
Topic: 3453 Message: 3453

In looking over a few camera listings on eBay, I see that the Canon Powershot A300 and A310 have a pretty good feature set for a balloon payload camera and were well reviewed when introduced in 2003 and 2004 respectively. Anyone on the list have comments, good or bad, on these cameras whether in 'normal' or balloon use? Better yet, if someone has one they'd like to sell let me know.

If they're easily modifiable, either should be a nice replacement for my Concord 4060.

For next year's GPSL, both NSV and Taylor have asked to host it. I'm thinking Indiana is a bit far for some people but fine for others. On the other hand, Indiana is good for the east coast (we've had some launch at GPSL in years past).

How does holding two super launches together sound? One would be in KC and the other at Taylor. If so, I'd like to work out an internet connection so we could present at both conferences. Taylor may do a BalloonSat workshop as part of their super launch (can you confirm?). If so, I'd like to do a small BalloonSat work shop for local clubs at the KC super launch.

Please let me know how you feel about two concurrent superlaunches next year.

This also brings to mind that we could make Bill's launch a super launch. Bill?

Paul

Thanks Mark:

I was using three 1.3 megapixel Batman Cameras from a long past Walmart clearance sale and a 3.1 megapixel Concord EyeQ 3042 AF that I must have taken about 50,000 pictures on before I decided I had got my money's worth and could risk it on the Balloon. :)

I'm using Gimp to tweak the colors. Hey, NASA enhances their pictures too.

BTW, I posted some more pics to that same album just now.

I prefer a single location.

I think this years event was the best that I have attended and I
think it was for these two reasons:
1) The post launch debriefing
2) The Saturday night dinner.

For me this gave me a chance to really meet the people behind the
callsigns, hear about each groups packages, and discuss the day's
events and future projects without the pressure of getting packages
ready for a flight.

I am afraid that having two locations will dilute the quality of
this Event.

I agree with Nick that the post flight debriefing and meals together provided us with good opportunities to share ideas and experiences.

If we were to hold two superlaunches next year in KC and Upland, Indiana then I imagine that most of the 2007 attendees would opt for KC. The only folks that would have a shorter trip to Indiana would be EOS-RED, Taylor, DePauw, and Bill Brown. The other eight groups are significantly closer to KC.

I enjoyed meeting the rest of you, and would seriously consider going to KC, despite the extra 800 miles of driving, if the NSF workshop at Taylor did not overlap.

I also appreciate the fact that as a University program, most of the BASE travel expenses are supported by our institution. Most of you do not have that luxury.

Perhaps the 2008 Great Plains Superlaunch should be in KC, and on a different weekend from the weekends surrounding the NSF workshop at Taylor. Taylor can certainly attract other ballooning folks (Valpo, Cedarville (new), UT-Knoxville, etc..) for a second superlaunch. I imagine that

I don't think that this is the time to run concurrent events.

I too agree the post flight briefing was a nice addition to this year's GPSL. I credit the EOSS group for coming up with that one and making the arrangments. Thank you Nick and the gang. I hope, as others have stated, it becomes a regular part of GPSL. It gives everyone an opportunity to share their experiences in an informal environment.

I'm not in favor of splitting GPSL into two concurrent locations. I think the more groups you can assemble at one location on an annual basis, the better. It gives us all a chance to become better friends and learn from each other.

On a personal note if GPSL were held in Indiana next year, Arlene and I would not likely be able to attend, due to her limited vacation time at her relatively new employment.

Thanks again for everyone that participated in GPSL 2007 and made it a success!

Congrats.

Paul

>>> <mconner1@...> 07/10/07 12:35 PM >>>
Reviewing the logged data, we recorded on the payload a maximum altitude of 110,915 ft at 14:03:32 UTC. This was about 13 seconds after the highest APRS beacon at 110,689 ft.

Our landing site was 40 deg 32.37' N, 98 deg 55.36'W at 14:39:15 UTC. Launch time was 12:19:04 UTC from 40 deg 46.75' N, 98 deg 22.52' W, for a total time in the air of 2h 40m 11s.

The interesting thing with our ascent rate data was that it did not show the typical slowdown around 40,000' that was discussed in one of Friday's briefings. Attached is a chart showing our altitude and ascent rate data. It starts off around 750 ft/min and slowly increases to around 1250 ft/min near burst.

The KC location is great with me as that is only a day's drive from Huntsville AL and even closer still to the TN, KY and midwest groups....660 miles from here.

Although IN is only 440 miles from here, I think it should be called a Midwest Superlaunch and I would agree that it should be spaced out at least a month from the GPSL event. Any further east than Missouri for GPSL would be a bit too far for major participation for the plains states I would think.

The upcoming 20th Anniversary ARHAB Celebration will be a Superlaunch this coming August 11th in Findlay, Ohio.....There will be a dinner at a local restaurant Friday evening for those who are in town and then a Superlaunch at 8:00 am from a farm 5 miles east of Findlay where I flew my very first balloon. After the chase, we will meet for lunch.

I am planning on holding a Southeastern Superlaunch (just like GPSL with a conference) from Huntsville AL but haven't set any dates yet for that....it will probably be a Spring or Fall event. I could also hold a Midwestern Superlaunch from Findlay, Ohio in the future and am available to help Taylor U if they want to hold one from Indiana.

3474. 20th Anniversary ARHAB Superlaunch Celebration Headcount and helium tanks?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-10 20:23:39 UTC
From: wb8elk@aol.com
Topic: 3474 Message: 3474

Plans are as follows for the 20th ARHAB superlaunch:

Friday evening, August 10th: Meet at local restaurant
Sat Morning at 7:00 am...meet at launchsite - 5 miles east of Findlay, Ohio
Sat Morning at 8:00 am...start of multiples launches
Sat lunch - meet at local restaurant after the chase.

Those wishing to fly a balloon, please confirm so I can get pricing on the helium tanks.

Those wishing to attend, please let me know so I can reserve a large enough room at the restaurant.

There is limited camper and RV space at my parent's farm about 5 miles west of the launchsite....let me know if interested in this option.

Here is the data for ORB.
As you can see the slow down started around 55k.

ALT FPM
50508 1017
51791 1283
53028 1237
54189 1161
55213 1024
56197 984
57073 876
57991 918
58903 912
59760 857

David,

Someone (maybe you) sent me an email asking for log files from the HARP49 flight. I've lost the email. However, I've attached to the file to this email. Might I ask you to forward it to whoever asked for it?

Note it's not complete as I only caught the last part of the flight.

Nick

From: Harry M
Topic: 3477 Message: 3477

Never Ever Give Up Hope of Recovery!

On December 6, 2006, OSU flew ASTRO-6 to an altitude of 96,000 ft. My 10m CW beacon was attached to the bottom of the payload train and it hitched a ride. On the recovery we saw many signs of post burst trauma and only one of the 10m dipole elements remained. I gave it up for lost and forgot about it. This morning (July 11, 2007) I received a call and was asked what I knew about balloons. The gentleman read the following... "High Altitude Balloon Experiment 28.565 Mhz". He said he was in Yale, Oklahoma. Then the light came on and I knew what he was talking about. He said he had found the beacon in a hay field about 2 miles north and 2.5 miles west of Yale, Oklahoma a few months ago. That would put it about 6-8 miles west of the landing site. He said he opened it up and there was a battery inside and it has been laying in his tractor ever since. The other day he asked a fellow farmer if he thought he should call the number on the placard and his friend said "YEP" (that's Okie for OK). I told him I would come out to Yale and buy him lunch. He said that would be great.

Glad to hear you're interested in other super launches. Now, if I can just start one on the west coast.

Paul

>>> <wb8elk@...> 07/10/07 2:14 PM >>>
The KC location is great with me as that is only a day's drive from Huntsville AL and even closer still to the TN, KY and midwest groups....660 miles from here.

Although IN is only 440 miles from here, I think it should be called a Midwest Superlaunch and I would agree that it should be spaced out at least a month from the GPSL event. Any further east than Missouri for GPSL would be a bit too far for major participation for the plains states I would think.

The upcoming 20th Anniversary ARHAB Celebration will be a Superlaunch this coming August 11th in Findlay, Ohio.....There will be a dinner at a local restaurant Friday evening for those who are in town and then a Superlaunch at 8:00 am from a farm 5 miles east of Findlay where I flew my very first balloon. After the chase, we will meet for lunch.

I am planning on holding a Southeastern Superlaunch (just like GPSL with a conference) from Huntsville AL but haven't set any dates yet for that....it will probably be a Spring or Fall event. I could also hold a Midwestern Superlaunch from Findlay, Ohio in the future and am available to help Taylor U if they want to hold one from Indiana.

Hi Bill, Paul et al,

From what I've gleaned, EOSS's eastern operational boundary is the
the Mississippi River, and then only once a year, max.

Sorry we'll miss that 20th anniversary flight :-{.

Paul,

I can confirm that we'll host the 2008 GPSL. I don't have dates in mind yet. We'll be having a meeting next week and will come up with a range of dates see what everyone thinks.

Troy

PAUL VERHAGE <paul.verhage@...> wrote: Well, I think I've heard enough. We'll have GPSL 2008 in KC. Can Taylor take on a MWSL on a different date? What days is your workshop?

NSV, can yoou confirm that you can do GPSL? Do you have a date in mind? I'll try to stay for the Saturday dinner. It sunds like it went well.

Paul

PS, Mark, do you have an extra shirt?

>>> "Harry M" <hhm_74115@...> 07/10/07 9:40 AM >>>

I am in favor of only one GPSL in the Plains states.

It would be great to see super launches such as a MWSL
or WCSL or ECSL to supporting ARHAB.

Keith Kaiser <keith.kaiser@...> wrote:
Here is a link to the pictures from GPSL 2007 (7/7/07). The Great Plains Super Launch went off like clockwork and we even got to see two of the 10 balloons land, it was great.

I think this might be the first or maybe second time that we have pictures of the entire flight, all the way up to 110,000 feet and all the way down again. Pay special attention to image89 on page 3, I think this is my favorite picture ever from the edge of space. It shows the sun, the blackness of space and the curvature of earth all in one photo. WOW!

As you can see the new nearsat (camera satellite) designed and engineered by Marvin Lynch worked great, we'll be using his design again soon when we teach the ACES class for the Boys & Girls Clubs of KC next month.

3489. BASE 9 and WW II ballooner

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-14 14:03:06 UTC
From: BASE
Topic: 3457 Message: 3489

BASE 9 was successfully completed on 11 July. It was a very interesting flight (two launches and a partially ensnared parachute during the final descent), and details will be on our website early next week.

The flight concluded with our payloads dangling 60 feet above the ground in a tree in a small grove on a farm in northern Rush county. When I met the property owner, he told me that he was in the Army Air Corps during WW II as a weather man attached to a bomber squadron. One of his tasks was to use balloons to determine the winds aloft via a theodolite. He told me about generating the hydrogen for their balloon fills in England and Europe via electrolysis! He also shared about the time that the RAF scrambled during one of their night launches and shot down two of their balloons.

Of course, he was very willing to help in the recovery of our payloads which brought our day to a successful end.

3490. Garmin GPS 18 LVC strip down

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-14 23:42:50 UTC
From: Brek Brixius
Topic: 3490 Message: 3490

Anybody ever take one of the little Garmin hockey pucks apart. I'm thinking a good portion of their weight is the magnet meant to stick them to the vehicle. Do they need that magnet?

I'm wanting to build an ultralight APRS system for a solar balloon. I am thinking about using the Garmin GPS 18 LVC, a tiny tracker 300 trying to mount an APRS inside the solar envelope. The air inside should be warm right. That is why solar balloons work. So, I figure I could ditch all the insulation on the APRS package.

Any thoughts anyone has would be greatly appreciated.

Subject: [KNSP] Balloon available...
Date: Sun, 15 Jul 2007 17:07:42 -0500
From: Jim Duncan <jdbandman@...>
To: KNSP@yahoogroups.com

Folks...

Having generally lost interest in ham radio I have been liquidating some
things that have been lying around gathering dust.

I have a Kaymont balloon and two of their parachutes that I would like
to get rid of. The balloon is about 4 years old however it has never
been out of the shipping box nor out of the plastic bag it was shipped in.

I'd like to see somebody that can get some use out of it have it. I paid
about $80.00 for the balloon and chutes originally...

Any reasonable offer will be accepted and I'll ship it off to you by
Priority Mail Flat Rate. Please contact me off list if interested.

No guarantees on the balloon considering its age but if you want to try
it who knows.... It may go to 90K+ feet and float forever or it may
burst upon filling!

Subject: GPSL conference, final thoughts

Jackie,

I received the invoice for our meals and conference fee, and the payment will be mailed tomorrow (Monday). I was going to compose a letter and include it with the payment, but I was hoping that by sending an email it might be forwarded to the hotel manager or someone of authority. I was extremely disappointed in the way things were handled for our conference. My understanding was we were going to be placed into the larger conference room and lunch was to be served in the smaller one. Instead we were packed into the small conference room and lunch was served in the common area. We were promised a sound system, but when I asked you about it you referred me to the other Jackie who informed me that the conference room we were in was small enough that "most people don't need one". She also told me that they don't use it because it bleeds over into the restaurant. That's not my problem and if you promise something you should deliver, much like I promised to pay for the room and the food, and now the check is on its way. I had asked for plug strips and extension cords, because most people would be bringing a laptop computer. There were two in the room. The podium for speaking was in horrible condition and looked like it had been around since the hotel was built. We were promised a cash box to make change from, but when we started taking money, nobody was around to provide this, nor did anyone bother to check and see if we needed anything. Some of the other nuisances were the frequent loud noises coming from the kitchen area adjacent to the conference room.

A large number of our conference attendees stayed at the Howard Johnson Riverside Inn. I heard many complaints from the folks that stayed with you. Some of these complaints were no hot water, air conditioner froze up, no light bulbs in the fixtures, room smelled of urine, reservations lost, to name a few. I have to say I'm kicking myself for not paying the extra money

to have this conference at the Midtown Holiday Inn and I assure you if GPSL returns to Grand Island it will not be at the Howard Johnson.

We were promised a sound system, but when I asked you about it you referred me to the other Jackie who informed me that the conference room we were in was small enough that "most people don't need one". She also

told me that they don't use it because it bleeds over into the restaurant. That's not my problem and if you promise something you should deliver, much like I promised to pay for the room and the food, and now the check is on its way. I had asked for plug strips and extension cords, because most people would be bringing a laptop computer. There were two in the room. The podium for speaking was in horrible condition and looked like it had been around since the hotel was built. We were promised a cash box to make change from, but when we started taking money, nobody was around to provide this, nor did anyone bother to check and see if we needed anything. Some of the other nuisances were the frequent loud noises coming from the kitchen area adjacent to the conference room.

A large number of our conference attendees stayed at the Howard Johnson Riverside Inn. I heard many complaints from the folks that stayed with you. Some of these complaints were no hot water, air conditioner froze up, no light bulbs in the fixtures, room smelled of urine, reservations lost, to name a few. I have to say I'm kicking myself for not paying the extra money to have this conference at the Midtown Holiday Inn and I assure you if GPSL returns to Grand Island it will not be at the Howard Johnson.

Subject: GPSL conference, final thoughts

Jackie,

I received the invoice for our meals and conference fee, and the payment will be mailed tomorrow (Monday). I was going to compose a letter and include it with the payment, but I was hoping that by sending an email it might be forwarded to the hotel manager or someone of authority. I was extremely disappointed in the way things were handled for our conference. My understanding was we were going to be placed into the larger conference room and lunch was to be served in the smaller one. Instead we were packed into the small conference room and lunch was served in the common area. We were promised a sound system, but when I asked you about it you referred me to the other Jackie who informed me that the conference room we were in was small enough that "most people don't need one". She also told me that they don't use it because it bleeds over into the restaurant. That's not my problem and if you promise something you should deliver, much like I promised to pay for the room and the food, and now the check is on its way. I had asked for plug strips and extension cords, because most people would be bringing a laptop computer. There were two in the room. We have striped down at least one GPS-18LVC out here in Maryland.
Without the casing and the magnets it is indeed significantly lighter.
The internals come out looking like a standard (but oddly shaped)
Garmin engine (completely enclosed like the GPS-15 or 25) with a
ceramic patch antenna mounted on the top.

I will try to get pictures and the actual weight out tomorrow when i
can get back to the lab.

There was one nice thing about the HOJO. Sure we had to hunt for light bulbs. Sure our AC didn't work. Sure the bathtub held water for several hours after you pulled the stopper.

But they did have a combonation Millipede, Centipede and Missile Command arcade machine near our conference room :D. Got my score up!

3502. New Column

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-20 01:33:14 UTC
From: PAUL VERHAGE
Topic: 3502 Message: 3502

Starting in September I'll begin a column called The Poorman's Space Program for the Society of Amateur Scientists (teir online magazine is called The Citizen Scientist). I'd like to set up a procedure to get experiments up on balloons and I'm looking for ideas.

Is there a preferred way to have someone design an experiment (to some specification) and then put it on a list for a lift? I envision something like the old Get Away Specials that NASA use to do with the Shuttle.

I'm thinking it would be designd like a BalloonSat and that the experimenter would be responsible for paying for a share of the helium and balloon cost. The experimenter would also have to pay for ground shipping te BalloonSat and acceptable the risk that it could get lost or damaged. There would have to be a central website where experiments get listed that groups could consult.

So anyhow, if you have any input please share it.

Thanks,
Paul

3503. Re: [GPSL] New Column

Yahoo group: GPSL (2002 — 2008)

Topic: 3502 Message: 3503

Paul:

That sounds very interesting. I think there are folks out there who like to fly balloons and/or track balloons while some folks just want to see if revision 9.9 of their gadget works.

Mailing a package and paying for part of a flight is a lot cheaper than operating an entire flight. Risking a particular experiment is still less than risking the loss of an entire flight plus the experiment. So, I can see some advantages to it.

Figuring out how to hook the package into their flight system and how to activate / operate the experiment may be a headache for the launch team.

I am interested to see what others think on this subject.

Hi Folks,

Nice piece of PR for ARHAB by the SimSat team and Pat Kilroy in
the current ed. of the ARRL Letter, appended below.

73 de Mike W5VSI, EOSS

--- clip ---
* SimSat Balloon to Launch: A high-altitude balloon carrying Amateur
Radio is being prepared for launch July 24 and 25 that will offer hams
and students in Maryland, Washington DC and a 20 state region a special
opportunity to participate in the operations. "Balloon launches are
being offered as part of a two-week science camp called 'Reach For The
Stars!' at the University of Maryland Eastern Shore," said Pat Kilroy,
N8PK, a long time space and near-space experimenter and engineer at the
NASA Goddard Space Flight Center in Greenbelt, Maryland. "Within minutes
of release from UMES, the balloon's radio footprint will grow to cover
all of Maryland, Virginia, Delaware and many adjoining states. At its
peak of about 100,000 feet, the signals from the balloon will be heard
by all within a 400 mile radius, reaching northward to Maine, westward
out to Detroit and Cincinnati, and south to Savannah," he added. Amateur
Radio operators are invited to participate. There is a list of tasks
that hams can do either on their own or in groups on Kilroy's Web page
<http://www.patkilroy.com/simsat>.

For next year's GPSL, both NSV and Taylor have asked to host it. I'm thinking Indiana is a bit far for some people but fine for others. On the other hand, Indiana is good for the east coast (we've had some launch at GPSL in years past).

How does holding two super launches together sound? One would be in KC and the other at Taylor. If so, I'd like to work out an internet connection so we could present at both conferences. Taylor may do a BalloonSat workshop as part of their super launch (can you confirm?). If so, I'd like to do a small BalloonSat work shop for local clubs at the KC super launch.

Please let me know how you feel about two concurrent superlaunches next year.

This also brings to mind that we could make Bill's launch a super launch. Bill?

Paul

3507. Re: [Ballooning] high stability az/el platform

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-25 03:20:14 UTC
From: Mike Manes
Topic: 3507 Message: 3507

Hi Art,

You've sure got the right idea for the platform from which to make those measurements. But there are a couple of issues here, other than the 1/4 deg az/el stable platform, that may be a bit daunting to most amateur balloon groups.

The first is a night flight, which will require a flashing strobe below 60K' if the flight is non-exempt. See 14 CFR 101.35(b). I, for one, think a strobe would be a good idea even for exempt night flights, not only for collision avoidance but also for verification of a clean launch and for recovery. The strobe power would have to be switched off via a 60K' baroswitch or other means to avoid disturbing the lunar albedo measurements, and more importantly, to avoid corona discharge EMI at the GPS and command receivers.

The second is that the balloon would have to be floater to minimize aerodynamic disturbances to the payload. This means either a ZP plastic (read expensive) or a valved latex (feasible but not an established ARHAB capability). Unless the flight were close to the spring or fall stratospheric turnaround, hanging out for very long up there could result in a long downrange recovery. And I'm assuming that this pricey precision aiming system would not be considered disposable.

Now, NASA does fly a lot of very heavy ZPs out of Palestine TX and Ft Sumner NM, and it might be possible to "hitch a ride" on one of those "Buick with 4 scientists" flights. Or maybe Bill Brown would like to give this one a shot?

As a final note, EOSS has built an azimuth-stabilized ATV camera mount based on a 2D electronic magnetic compass and a servo that drives the low-inertia mount against the high-inertia payload structure. It works OK, but is no way as stable or as accurate as you require; it just prevents mal de mer when watching the downlink video :-}. It's also a WHOLE lot lighter than an effective bar magnet! This scheme may be workable if a high-precision 3D compass were used on a floater, with means for manual fine pointing corrections via command uplink; the earth's magnetic field is anything but uniform.

Of course, I've been wrong before ...

Hi Eduardo et al,

Another good book on this topic is Craig Ryan's "The Pre-Astronauts", 1995,
Naval Institute Press, Annapolis MD, ISBN 1-55750-732-5.

My copy is especially prized since it's autographed by Joe Kittinger N4HDP
himself! That was my reward for adding DTMF to his Icom IC-2A HT so he
could hit "moderen" repeaters during his manned He balloon flights :=}.
Joe still holds the world record for bail out altitude (103K') and
the free-fall speed record of over Mach 1 during the Manhigh Project;
he was the first to cross the Atlantic in a solo balloon.

73 de Mike W5VSI, EOSS

PS: Joe's callsign phonetics are Hot Dog Pilot - fitting, eh?

Bill,

what is the latest date for helium reservations?

i may have a balloon to launch, but I'm not going to try the trip by myself
if no one else in Bridgeton, MO wants to do an away from home launch.

Sincerely,
Carlton Corbitt

Subject: [GPSL] 20th Anniversary ARHAB Superlaunch Celebration Headcount and helium tanks?

Plans are as follows for the 20th ARHAB superlaunch:

?

Friday evening, August 10th: Meet at local restaurant

Sat Morning at 7:00 am...meet at launchsite - 5 miles east of Findlay, Ohio

Sat Morning at 8:00 am...start of multiples launches

Sat lunch - meet at local restaurant after the chase.

?

Those wishing to fly a balloon, please confirm so I can get pricing on the helium tanks.

?

Those wishing to attend, please let me know so I can reserve a large enough room at the restaurant.

?

There is limited camper and RV space at my parent's farm about 5 miles west of the launchsite....let me know if interested in this option.

?

3510. Re: [Ballooning] high stability az/el platform

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-26 00:52:22 UTC
From: Mike Manes
Topic: 3507 Message: 3510

Hi Art,

I assumed that this would be a night flight since you were looking
for lunar illumination from terrestrial street lights :=}.

Wish I knew where to send you to start the process of getting aboard
a NASA balloon. If you can touch base with a local NASA Space Grant
College, that might get you heading the right direction.

And the EOSS magnetic az platform is good for maybe +/- 2 or 3 degrees
when the payload is hanging from the ceiling in my shop. The mag
compass resolves magnetic bearing to 1 degree. But in flight, with
the payload slewing, it holds maybe +/- 15 degrees - a SWAG, since I
haven't measured it.

Now, timing the flight to coincide with a lunar eclipse, local night over
the US or Europe and during stratospheric turnaround might leave you
turning gray! I'm thinking that, although I don't want to disparage
a balloon-based science experiment, you might be able to do the job
from the surface - perhaps at a good telescope site - using some heavy
and powerful signal processing equipment, integrating results over
many hours/nights of observations.

Yes, a balloon will get you above the clouds and will reduce atmospheric
attenuation - but there's not THAT much attenuation at Na vapor emission
wavelengths, is there?

73 de Mike W5VSI, EOSS

Both Excelsior and Man-High projects are incredibl e early space projects that took incredbly brave men, the pre cursors to... hmmm, no the first modern astronauts. Incredibly dangerous, incredibly unforgiving environment, space.

A great book on Excelsior is: THE LONG LONELY LEAP by Kittinger. with a complete story of his record breaking Jumps, some of which nearly killed him, with various system failures. It took so little to go wrong to kill test pilots, one near miss for Joe Kittinger was when his pressure suit did its normal expansion at altitude in the open gondola, caused him be be wedged into his (now) tight fitting seat, and he could not simply stand up and step out at the prescribed altitude. In the heavy heaving and wrenching that followed to free himself from being wedged into his seat, he tripped a timer lanyard that was to delay his pilot chute deployment, for a number of seconds after he left the gondola, with the resulting deployment happening only 2 seconds after leaving, and caused the limp pilot chute and attached parachute sytems to snag, envelope his body, almost killing him, and making him (being unconscious due to oxygen cutoff) fully dependent on the automatic reserve chute to miraculously deploy at about 18,000 ft through the garbage around him during the whole freefall.

Even testing in the altitude chamber he had a very close call at very high "altitude" when his full pressure space suit helmet almost uncoupled from its clamp. A last minute safety, extra tie down, piece of parachute cord on the helmet saved Joe's life on that one. I am sure he bought his rigger a drink, at the local bar after that one. I shudder to think, to be. the altitude chamber operator watching through the window to see the results of a pressure suit helmet blasting off a human test subjects head, at, say 80,000 ft.

Some interesting Sites re space ascents, high altitude jumps, etc...

Carlton,

I am in kind of the same situation, I too would like to attend and
launch a balloon. I live in Topeka & fly out of Kansas City.
If I attend I will be driving right thru St. Louis.

If you are interested you can contact me directly and we can see
what we can work out.

Best Regards,
Nick Stich

3514. [astro-officers] Launch Space Available for Piggy Back Satellite

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-28 13:26:15 UTC
From: Joe
Topic: 3514 Message: 3514

This Came from Another list I'm On.

don't know if it's legit or not,,

Juast for any that's interested.

joe & NSS

ASASC Friends,

I have information about the availability of a piggy back launch
opportunity on a reliable international launcher.

I am not allowed to divulge all of the information related to the
launch in this group email, but here are some hints.

Launch = 1st Quarter 2008
Auxiliary payload weight = 100-120 kg.
Orbit = Sun synchronous

I have marked this posting as URGENT, because we only have 7 to 8
months prior to launch. Usually one needs an advance notice of 12 to
15 months for auxiliary payloads. In this particular case, the launch
provider is willing to make an exception and facilitate expedited
processing by greatly accelerating the process.

Any of you out there, who are looking to launch an auxiliary payload,
or know anybody who might, please email me or call me ASAP.
I am based in San Francisco.

Phone: +1-415-254-5812
susmita.mohanty@...

Cheers, Susmita

Hey Joe,

"Sun synchronous" is orbital, not a balloon.

I would like a copy of such a disc to take to my ham club meeting there has been an interest sparked by the SONS DRILL back in June. This disc would help other members of the club and maybe launch a club balloon project in the future. If someone has a powerpoint program promoting ARHAB and could share a copy with me that would be great also.

3520. Tracking component assistance

Yahoo group: GPSL (2002 — 2008)
Date: 2007-07-30 17:11:25 UTC
From: Jim
Topic: 3520 Message: 3520

I want to become active in the tracking aspect of this.
I need an Elmer,

I have the following equipment:
-a D700A,
-a Garmin GPS 12 unit,
-a Garmin GPS18 I use via the usb port on my Laptop in the truck
using nRoute software,
-Precision Mapping Streets Travel v. 7.0 installed
-UI_View-32 Installed
-The Laptop in a Gateway MX7711 using XP Home Version 2002 Service
pack 2 with three USB ports no serial ports,
-Processor is a Mobile Atthlon 64 3400+ 787 mhz 448 MB of Ram with a
80 GB Drive.

What else do I need to begin to track the Balloons?
I'd like to be running before I return to work on the 20th of August

A hand-held 2m beam might be handy once the payload is on the deck.

Jim

A USB serial adapter will work to connect the computer to the D700, to decode and display APRS information. Depending on the adapter, your mileage may vary, but I have had good luck with the adapter I purchased.

To take full advantage of UI-View ability to display your current APRS location on a moving map (Precision Mapping), you need to connect the GPS to the D700's GPS (serial) input. UI-View can redirect the GPS information supplied by this port to display your current APRS position. You will not be able to use a USB serial adapter to connect to this port as there is no way to load the drivers through the D700. Perhaps there is a USB to Serial adapter that does not need Windoz drivers, but I am not aware of any.

I am also not aware of any "feature" in UI-View to redirect the information from another port (serial or USB) on the computer to accomplish function. While this is not a "make or break" feature, it is a nice one. If the GPS 12 is a serial unit, connect it to the D700 GPS input and you will be good to go.

Good Luck in getting your setup working. IMHO, UI-View with a D700 is a great way to go.

From: Brek Brixius
Topic: 3520 Message: 3525

There are probably different ways to get to a working system. I am not familiar with the D700A and you may not be familiar with my equipment but I use UI-View 32 as follows:

I use a Radio Shack handheld scanner (pro 50 I think) as the receive radio. I have an adapter that lets the scanner use an external mag mount mobile antenna. The scanner radio is connected to a KAM (Kantronics TNC) which is connected to the 1 serial port I have in my laptop (COM 1). That is the part that receives the packets from the balloon.

I use a Garmin 18LVC on the roof of my tracking vehicle. I power it from a 5v regulated power supply. It has 9 pin serial plug which I use for some applications but when I track the balloon I use a no-name serial to usb adapter to connect the GPS 18 LVC to the laptop as well.

UI-View 32 then recognizes the balloon packets on com 1 and the GPS 18 LVC on com 5. So the balloon's position is displayed as a balloon with a red ring around it and my position in the tracking vehicle is displayed as cross hairs.

As for your mapping software, again I am not familiar with it. I am using an old copy of Delorme Street Atlas (circa 1999). UI-View 32 has an accessory called SA Map Grabber that will take snapshots of the Street Atlas map. So before a flight I will go run a predict, then use SA Map Grabber to make sure I have close zooms of the entire area near the predicted landing site. That way when I tell UI-View 32 to track the balloon it automatically selects a map that is zoomed in on the location of the balloon and I can see the minor roads in the area.

Mainly because my laptop battery is shot (and because it is convenient) I power the whole works from an inverter. Just make sure you don't shut the vehicle off during a chase.

Well that is what works for me.

Good luck with your setup. I hope you find some of this helpful. :)

Don't know if it was mentioned already or not but some USB to Serial
converters work better than others. Actually I should have said some
converters work and some don't. Generally you should stay away from the low
cost ones are they tend to be cheap? ;-)

Not sure but I thinnk some body has put together a list some where of the
ones that work and the ones that don't.

There was a brief problem with the GPSL ftp site, but has been resolved. Harry KC5TRB and myself were the only ones that I knew of that had transferred files to the site. I have Harry's contribution, but I'm still waiting on others. Please upload your presentations and any other pictures, video, or data to the site that might be of interest to others and I'll put together a disc or discs to send out to each group that attended GPSL 2007.

Please upload your files to

From: Mark Conner
Topic: 3528 Message: 3528

Hi everyone,

I was playing with ArcMap and some of my log data from NSTAR 07-B and I was reminded that I should check into creation of KML files from my log data for 3D visualization.

I have positions every 2-3 seconds for the entire flight, so it's a pretty high-resolution track. Does anyone have any bits of code or (preferably) executables that will take position data in some form and generate KML out the other end? I looked at the KML file someone (Rick?) generated for EOSS-120 and it's pretty extensive.

Anything that would keep me from doing this by hand would be helpful. :)

As many of you may have seen on the news....there was a disastrous explosion at Burt Rutan's Scaled Composites rocket test stand in Mojave, CA last week. They were testing out the rocket engine for Space Ship Two for space tourism.

One of our very active balloon and rocket team members, Glen May, has been working for Burt for the past 4 years and was tragically killed during last week's explosion. Before moving to Mojave, Glen was active here in Huntsville AL in testing our Project HALO rocket and on the launch team boat in the Gulf of Mexico with us when we did our rockoon flights for the HAL5 chapter of the National Space Society for Project HALO (High Altitude Lift Off)....and was also instrumental in High Altitude Research Corp's BLRV (balloon launched return vehicle) and the CATS Prize rockoon. His knowledge of rocketry along with an unbridled enthusiasm and sense of adventure made for a combination that is truly rare among us and he will be greatly missed.

Mark:

I'd suggest looking into GPS Babel (www.gpsbabel.org). I know that it has a custom style conversion feature, so even if your data isn't in one of the many supported formats, you should be able to run a successful conversion. I've been using this little app to do 3d viz for TU's HARP flights for several months (converting from DeLorme's otherwise incomprehensible *.gpl files), and couldn't be happier with the results.

Hope it helps!

Balloon Track can do this. However, you need to first run the data file through the program in simulation mode. BT will create an ascii delimited file of the APRS data. You can then go to the file menu on the main program screen and select [File/Convert] and point the dialog to the ascii delimited file (called Flight_Data_xxxxx.csv"). If you are putting out data every few seconds I would suggest you not open up the Flight Analysis screen, or if you do, immediately disable charting. The VB charting engine is totally lame and boggs down incredibly once you have a few hundred records in it. But, you don't need to do this in any case. Just run the log through the simulation mode on the Packet Terminal screen and then do that Convert thing and you should be good to go.

I wrote an article on Google Earth last year that you might want to look at.

I use a spreadsheet to format the GPS reports and then save it as a comma delimited file. The text file is then copied and pasted into a sample KML file. All I have to do then is adjust the lookat point.

Nick,

sorry to say but I'd kind of prefer not to go.

My wife and son got a head cold?which kept me from working on the balloon parachute and payload?so?our balloon won't fly yet.? And the guys at the club meeting didn't want to go mostly because of local hamfest but partly because we don't have a flight package.

You probably don't know this but the MO state fair is the 9th - 19th and my wife has asked to go to it that weekend.

I hope this doesn't ruin your plans.??
I used to fly with the balloon club UTARC from Knoxville, TN and 5-6 buddies of mine should be there with balloons, but I'd also like to take my son to the fair.

Sincerely,
Carlton Corbitt

Carlton,

I am in kind of the same situation, I too would like to attend and
launch a balloon. I live in Topeka & fly out of Kansas City.
If I attend I will be driving right thru St. Louis.

If you are interested you can contact me directly and we can see
what we can work out.

Best Regards,
Nick Stich

I finally got around to assembling the OT1+ that I won at GPSL 2007. Amazingly it works. I say amazingly because 1. I had an OT1x that I was never able to get it to send altitude. 2. I stayed up late last night and it wasn't my best effort at assembly.

Anyhow, I downloaded the new configuration program from Scott's web page and tested the OT1+. Everything worked fine. I really like the multicolor LED by the way. Makes it much easier to tell the status of the unit.

I was encouraged by the success with the OT1+ to try my old OT1x again. It still didn't send altitude. So I used the new config program and dropped the same configuration I had put on the OT1+ on the OT1x. What do you know... It works. Maybe there was something corrupt in my copy of the older version of the config program?

Well, I'm a happy camper now. Thanks Scott. :)

Things are coming together for the 20th anniversary ARHAB celebration this August 11th at 7:00 to 9:00 am in Findlay, Ohio....directions to the launchsite are now posted and a list of the flights....frequency and time slot details will be posted by Tuesday.

Preliminary weather looks great...but if any problems, Sunday is the raindate at the same times.

Note to Ralph: Nick Stich K0NMS is now added to the flight list.

My plan is to send one copy to each group that attended this year's GPSL at no charge.
Other requests for copies will be charged a small fee to cover postage. I'll post a note to this list when the disc(s) have been completed. So far, I've only had a few groups upload anything, but hopefully more will participate.

Thanks for your interest.

Sent: Thursday, August 09, 2007 12:51 PM
Subject: [solarballoons] ULDB pumpkin test in Elizabeth City NC

This was a very successful series of tests. There were 2 test articles, one being a new build scaled 27m diameter pumpkin with a max bulge angle of 55 degrees and the next tested being the original 27m pumpkin first tested last March, but with 10 out of its 200 gores trussed-up by sewing the fin-flanges together. They both deployed beautifully in a simulated ascent to 100000 ft by injecting only the scaled amount of lift and then back-filling with air to simulate expansion of the helium.
Large super-pressure pumpkin balloons have been plagued with a peculiar type of buckled shape that we have called an s-cleft. It is caused by having too much bulge material for the given number of gores. Last March, we tested a scaled version of the Sweden pumpkin (flt 555) in order to produce and study the s-cleft phenomenon. It successfully reproduced the s-cleft in captivity. We determined that the shape was not the result of tendon locking or friction, but an actual low-potential energy alternate shape that evolved from the wrinkled and clefted low pressure ascent shapes.
These tests have proven that we can scale the large size balloons properly to a testable size to indicate whether or not a particular design will properly deploy. See the group photo of the team in front of the deployed pumpkin under the photos section. That's me in the red shirt, far left

Rodger Farley, NASA/Goddard Space Flight Center

3557. saturday launch.

Yahoo group: GPSL (2002 — 2008)

From: Joe
Topic: 3557 Message: 3557

Hi Ralph,

Jeff I guess isn't understanding me, so I guess we will go with our original plan on linking with Bill's ELK balloon.

Bill and us here in Wisconsin will be sharing 146.52.

So when the two payloads get high enough to see each other they will link up so to speak, and really spread the possible footprint out.

NSS-44 freqs will be 146.52 and 446.000 TX/RX on BOTH, goes either way.

We expect to launch between 8 and 9 AM on Saturday.

Joe Near Space Sciences

3558. Updated flight frequencies for 20th ARHAB celebration August 11th - Findlay OH

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-09 20:45:42 UTC
From: wb8elk@aol.com
Topic: 3558 Message: 3558

Launch between 8 and 9 am August 11th from Findlay, Ohio:

Talk-in freq for launch and activities: 147.15 Findlay Radio Club repeater

Balloon frequencies:

WB8ELK - I'll be flying just 1 balloon - no ATV repeater input this time,
just ATV transmit on 439.25:

ATV: 439.25 HP (live camera with GPS overlay)
2m simplex repeater: 146.52
Voice Beacon: 147.42
APRS (144.39): WB8ELK-12
APRS (144.34): WB8ELK-12

KC8UCH:
Superpressure and possibly a solar balloon as well
APRS (144.39): KC8UCH-11

UTARC:

APRS (144.39): AA4UT-11
RTTY (14.060)

K0NMS:

Rino 110 FRS/GMRS downlink

TaylorU:

APRS (144.39): KB9ZNZ-11
Crossband repeater: 146.46 in - 446.025 out - W9TE net control
Part 15 SS

Univ of Akron:

Part 15 SS

For those attending, we will be meeting at the Bob Evans on the hwy 224 exit
of I-75 in Findlay, Friday night at 6 pm.

nope bills is simplex repeater,

we could do it as hoped with two similar flights as ours, just
different UHF freqs, then no loop.

3567. Four payloads recovered...one still flying

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-11 23:16:50 UTC
From: wb8elk@aol.com
Topic: 3567 Message: 3567

Great weather at the 20th and lots of people from several states in attendance....we did a picture perfect group launch of 4 balloons: WB8ELK, K0NMS, KB9ZNZ and U of Akron.....all have been recovered in fields and one in a tree.

The KC8UCH-11 superpressure balloon was launched an hour or so after the first 4 balloons and is still flying at 7000 feet and is heading slowly due south towards KY and TN.

Date: 2007-08-12 16:10:26 UTC
From: Joe
Topic: 3568 Message: 3568

I got up this morning to check on the flight, and it appeared to have landed some time near 2 am CDT here for i saw last report heard was at that time with a altitude of a little over 1000 feet.

but it appears that the sun has warmed it back up and it's flying again at near 7k feet again.

or am i seeing things..

Joe

HYSPLIT predicted a descent last night due to vertical currents
(superpressures below 700mb are very susceptible to such things).

If you check the last location against a topo map (ACMEmapper), you'll
see that it was in a narrow river valley... I think that it was
caught under a low-level inversion.

Yes, it is flying now.... :)

Some quick details about this flight:

Balloon is a cylindrical superpressre, volume 25 cubic feet. Payload is a Microtrak 300, Digitraveler GPS and two lithium 9v batteries in a Tyvek mailing envelope (you know how I love under-engineering things!).

Updates on the flight are posted at http://arhab.blogspot.com.

73,
Robert

3571. Updated landing site prediction for KC8UCH-11 for Sunday night

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-12 18:37:04 UTC
From: wb8elk@aol.com
Topic: 3571 Message: 3571

Just ran the Hysplit model and if it comes back down around 3 am like it did last night, that would put it down SE of Crossville between Knoxville and Cleveland TN area tonight at 3 am....so while out there watching the Perseids, you might see a super pressure meteor balloon.

I was surprised to see that the KC8UCH-11 balloon took off again this morning...either it was hovering or perhaps was resting in a grassy field but sure enough up it went again and it travelling southwest just SW of Lexington, KY at the moment.

Congrats Robert on a fascinating balloon mission!!

You mean you think it might have been trapped at a low altitude and
that it never landed at all?

I was going to run the last heard position this morning and the first
heard position later on and see just how far apart they are.

I find it absolutely amazing that it could land without snagging a
tree or some brush, then lift off later without snagging a tree or
some brush! If it landed and then lifted off again,. it must have
landed in a big pond or a very large field that had been mowed recently.

If it did indeed land and then lift off again, it has to be a 1 in a
million chance! In the desert, I could see this as being possible,
but in an area that has brusha dn trees----it seems nearly impossible to me.

This is awesome!

If this balloon is landing at night, the same technique could be used
to cross the Atlantic or the Pacific.

Regards,

Art

3574. Updated and corrected flight path predictions for KC8UCH balloon

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-12 20:25:45 UTC
From: wb8elk@aol.com
Topic: 3574 Message: 3574

I meant to say Cookeville, TN (just east of Nashville) on my last post.....that's where it will be at around 3 am tonight and where it could land if it did what it did last night.

If it keeps flying overnight...it will head south from that point and be over Huntsville AL area around noontime Monday....after that it will head towards Birmingham and Mobile and then along the Gulf Coast to the west and loop up through Texas if it stays up several days.

3579. Re: SDG-6 details as required by the records...

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-13 09:33:42 UTC
From: Ralph Wallio, W0RPK
Topic: 3579 Message: 3579

Robert --

Thanks for another in your continuing series of extraordinary ARHAB achievements! I will be assembling the details later this morning and updating our Launch Announcements and Records.

All-time distance and time records will be updated for your complete flight. Annual contest entries
will be shorter because we have a <2-hour telemetry requirement. For our 2007 Annual ARHAB Contest,
the flight is terminated when telemetry has not been received for more than 2-hours. This does not
apply to our all-time records.

But at 0723 hours it reported being at 1072' ASL. Then, nearly 8 hours later, it reported being a ? mile away at 3218 ASL. Something held it in that ? mile area for almost 8 hours.

Calm winds in a narrow river valley... When I plotted the last
position at night using ACMEmapper's topo map, it put it right above
the river inside the walls of the valley...

Congratulations on an outrageously successful flight and advancing
the state of the ARHAB art another notch! Kudos!

I hope you'll be strutting your stuff at GPSL in KC next year.

Happy Birthday to Joe Mayenschein WB9SBD, Chuck Crist W9IH, myself WB8ELK and several other balloonatics born on Aug. 15th. Must be something in the stars that leads us into ballooning?

Those with birthdays on August 15th that I haven't listed...please email me as I'd like to see just how many of us share that date.

I remember that Troy Campbell KC0MIC of NSV had told me his bday was also August 15th at a past GPSL....so at least 4 balloonatics that share August 15th....that seems to be statistically astronomical of a coincidence. I'm celebrating the 15th anniversary of my 39th.

Yes, it was recovered in southern Kentucky about one hour after it landed. The total flight time was over 32 hours. See my blog at http://arhab.blogspot.com for the full story.

Cheers,
Robert

3594. KC8UCH-11 balloon now aloft

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-22 14:14:19 UTC
From: Robert Rochte
Topic: 3594 Message: 3594

Our latex-towed solar Montgolfiere is aloft now... We have decided to name this balloon "Soli Deo Gloria 7" - or SDG-7 - even though it is not a superpressure like the rest of the SDG series.

It can be tracked using Findu or APRSWorld with these URLs:

http://www.findu.com/cgi-bin/find.cgi?call=kc8uch-11

http://db.aprsworld.net/datamart/switch.php?call=kc8uch-11&maps=yes

Prediction shows the balloon flying to the east-south-east, over Lake Erie, then the latex should burst. At this point, the solar should inflate and stabilize around 70k feet (very rough estimate at this point) and return to the west.

Very slow ascent rate due to not enough gas - not sure what this will do to the entire flight....

-R

Set slow (~3 minutes) to conserve battery - but it's now looking like
this was a bad idea... Some sort of failure has occurred.... I'm
guessing that the payload is in the water now.

I saw that. All you needed was about 5-6 more miles to clear the lake.
Hopefully you got that. Depends upon what the surface winds were doing
and the descend rate of the payload.

Stupid design error - discovered at great expense.

Bill Brown wrote to me yesterday, asking if there was a cut-down of some sort to release the latex balloon. If not, he warned, I would need to make sure that the solar Montgolfiere could handle the added mass.

I wrote back quite confidently - sure, the solar balloon can easily lift another 750g! But..... How does that compare to the mass of the payload??

Payload was less than half the mass of the latex balloon...

Oops.... Latex burst, entire system starts to descend and solar balloon starts to fill.... Then the balloon turns over like a slinky and spirals out of the sky, latex first....

A sad day here in Detroit......

...well sort of.
My wife Arlene KC0ZWX and I were on vacation last week in Colorado. I had emailed some of the EOSS gang about Colorado repeater frequencies before we left and Mike W5VSI and Nick N0LP offered to meet us for lunch if we were to be in the area. We had planned to be transitioning through Denver on Tuesday and arranged to have dinner at Casa Bonita's. Sorry guys, next time we'll let you pick the place. The company and the atmosphere was better than the food, but we appreciated them taking the time to sit down with us and have some pleasant conversation and we enjoyed the camaraderie. I managed to check into the EOSS net on Tuesday night from our cabin near Cripple Creek. The photos were taken outside of Casa Bonita prior to our departure. The first is Nick, Arlene, and Mike, the second is me and Arlene. Thanks again guys, we appreciate all of the tourism tips you gave us. Oh, and I-25 aka the "Ribbon of Death" wasn't too bad heading to Colorado Springs, however, I avoided it on the way home.

Hi Keith,

The end of July or the first of July are ok with me as is the extra day.

Balloons Over Perryton

Reach For Space High Altitude Ballon group and the Top of Panhandle ARC are hosting a one day mini-balloon conference at the Allen Campus of Frank Phillips College in Perryton, TX on Saturday, October 6th. Breakfast and lunch will be served. (pre registration needed for head count) Presentations in the morning and (weather permitting) fly balloons in the afternoon. Hope to have a web page up soon with better info. Perryton is south of Liberal, Kansas on highway #83.

You are welcome to come fly with us, but I will need to hear from you (k5is@...) so there will be helium available. Jerome, K5IS

Dear Keith and friends,

BASE (DePauw) is very flexible with the time frame for GPSL next year (anytime between June 1 and August 10 is fine for us). I imagine that we'll be involved with the NSF workshop at Taylor, but I haven't heard any dates for that event.

Personally, the extra time might allow me to get back on the Jewell campus. They have added a nice observatory which I could see about for an evening activity for our group, if anyone is interested.

Moving GPSL away from the holiday will definitely make getting there easier for HARP (Taylor University) - end of July and early August sounds good. I like the idea of the third day, but don't know how feasible that will be... that call will have to be made as the time approaches.

Looking forward to it already!

3607. GPSL 2008 dates - FD weekend some future year?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-08-31 14:42:30 UTC
From: mconner1@gmail.com
Topic: 3607 Message: 3607

NSTAR has a slight preference for the 4th of July weekend. At least one of our members will be involved with pre-start-of-school activities (marching band) by the first weekend of August. However, we would still participate in a late July/early August GPSL 2008.

I'm not sure if we can participate for a full day on Thursday. A lot depends on the vacation time I have available by then. Based on the comments from this year's GPSL, I do plan to stick around for the Saturday afternoon/evening recap of the day's events.

I had some thoughts about combining a future GPSL with Field Day, but to combine it effectively would lock us to one launch site, which is not a good idea - a last-minute change due to track forecasts would be a real bummer for all concerned.

Keith,

Those dates will work for me.

My thought on the extra day is that is would be good if it was really filled with activities that were in addition to what we have had at previous events.

I would NOT be in favor of just having the same number of activities spread over an extra day.

Cheers,

I like the idea of an extra day. My class is talking about holding
their reunion on either the last weekend in July, or the first weekend
in August.

On the other hand, a non-holiday weekend generally works best for Jon.

From: Harry M
Topic: 3613 Message: 3613

ORB-23 was launched at approx. 0757 CDT. The ascent was a little slower than predicted. With very light winds the chase team was able to stay ahead of the flight and make several stops along the way to get snacks, work several stations on the Parrot Repeater and generally just hang out, all while visually keeping an eye on the balloon. Burst occured around 98,000 feet and descent was as predicted. The flight descended right across Cushing airport while Sky Divers were also descending. ORB-23 landed 200 feet from the hangers and just off airport property.

Here are the landing coord's... 35.953 -96.777167

After recovery some of the chase team went to the car show in Bristow for lunch.

Thanks to all who participated!

3616. mystery object

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-03 15:45:03 UTC
From: Roger Hammond
Topic: 3616 Message: 3616
Attachments: 1 described; binary payloads are missing from this source WARC

The payload camera on CNNSP-09 took a little over 200 pictures yesterday, before the batteries died. I installed a brand new 1GB card and the timer was set for a photo every 30 seconds, unfortunately I forgot to turn off the flash, and the batteries did the best they could.

This picture that was taken ascending through 75,000 feet, has me a little puzzled. There's an object that showed up in the upper right portion of the screen. If this had been a multi-balloon launch, I would have thought it to be another balloon. It was the wrong time of day for a NWS radiosonde, in addition to the closest station being over 100 miles away and the light winds aloft, it wouldn't have made it downrange this far.

There were no loose pieces and/or parts fluttering around on either payload (until after burst), so I have no idea what this object is.

Any ideas?

Rog

3619. GPSL 2008 Dates

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-03 16:32:33 UTC
From: Keith Kaiser
Topic: 3600 Message: 3619

GPSL'ers,

I had quite a few responses to the question about when to hold GPSL in 2008. Only one individual had an alternate date idea (Jul 4-5-6), but several commented they liked the proposed dates for a number of different reasons. So with all that said, we are going to lock in July 31, to August 3, 2008 as the official dates for GPSL 2008.

The extra day did generate a few comments but mostly they centered around what we will do with the extra time. The number one concern being that we didn't just use the extra day to spread out what we already do. At this point Thursday, July 31 is tentatively to be used as a static display and workshop day. We hope to have displays from NOAA, FAA, CAP, NASA, Garmin, and others, if you have a display or workshop you would like to propose or do yourself please let me know. If you have other ideas about Thursday and I can think of a bunch, let me know that too.

Proposed:
July 31 -- Static Displays, Workshops, astronomy night?
Aug 01 -- Conference presentations, flight briefing
Aug 02 -- Launch, recovery, debrief
Aug 03 -- Weather Date, departure

Location is our next assignment, now that the dates are locked it will be much easier for us to find the host site for the event. Please visit nearspaceventures.com/gpsl2008/ from time to time and watch your e-Mail for updates on this and other details about next year.

If you would like to help with GPSL 2008 in almost any capacity, please contact me and I'll put you to work....trust me.

Our goals for 2008 are lofty, as they should be given what we do (launch high altitude balloons) and we are going to work hard to make this the best GPSL ever. This is a tall order, given that year after year the quality of the conference has gotten better and better, and last years was such a run-away success it will be doubly hard to beat. So aim high, stay in touch, keep an eye on the web site, put the dates on your calendar and grab hold of something....we're about to take you 20 miles up.

Kansas City or Burst!

Roger --

CNNSP-9 was at 75kft ascending at 14:59:08. At this time the moon (from the payload at altitude)
was at 34.9d elevation and 270.3d azimuth. Lunar illumination was 67%.

My guess is that the object is the moon but it is smeared by payload rotation vs. shutter speed.

I don't think it's the Moon though. what it actually is i don't have a clue but for two reasons I don't think it's the moon,

1- it's TOO white,, the moon in daylight is very pale in color, just like in the example photo of the moon and balloon in the same shot. I've taught astronomy for 40+ years and am a Avid Astronomer and i have never seen the moon this pure and bright white in daylight.

2- it's WAY too large of an image. that image size would be at least a 100 mm lens if not longer,, and i doubt if anything like that was flown on a payload.

Joe

I don't think it's the Moon though. what it actually is i don't have a clue but for two reasons I don't think it's the moon,

1- it's TOO white,, the moon in daylight is very pale in color, just like in the example photo of the moon and balloon in the same shot. I've taught astronomy for 40+ years and am a Avid Astronomer and i have never seen the moon this pure and bright white in daylight.

2- it's WAY too large of an image. that image size would be at least a 100 mm lens if not longer,, and i doubt if anything like that was flown on a payload.

Joe

As we see the moon from the suface, yes the moon is pale & yellow due to atmospheric haze. Get above the haze layer, which is usually around 2k-4k ft around Oklahoma and the moon is white.

I have seen this while night flying in a private plane and I have pics from other Balloon flights at altitude that show the same size/color of the moon as Rogers.

I too am an amateur astronomer.

Thanks Joe --

Do your thoughts about color temperature for the moon factor in the difference in Atmospheric Mass
(AM) between the surface and 75kft? On the surface with lunar elevation at ~40d AM is ~1.5. At
75kft AM is 0.0332. The color temperature at altitude would be substantially hotter approaching
pure white.

Ok,, that one i'll agree with, diddn't think of that.

best thing to test on image size is to take a shot of the moon now
well tomorrow,, it's up after sunrise and will set close to quarter
to 3 or so. take a shot with the same camera and compare image sizes.

Roger,

Was the image you sent a cropped image or the full frame?

My money is on it being the moon, but failing that, perhaps it's a
lens flare or a piece of dust on the lens that was lit just right.

If the camera was in autofocus mode, it likely had difficulty with the
focusing since it had a blank sky for a target - it it was out of
focus that would enlarge the appearance of the moon in the frame.

Hi Joe,

You sure?

1. You've never seen the moon thru a telescope from 75,000' MSL,
I betcha. The sky's a lot darker at 30 mbar palt.

2. The moon subtends about 0.5 degrees, and that image covers
about 1% of the width of the foto which prolly had a 50 deg FOV.

I would be interested in doing a BalloonSat workshop.

Paul

>>> "Keith Kaiser" <keith.kaiser@...> 9/3/2007 10:32 AM >>>
GPSL'ers,

I had quite a few responses to the question about when to hold GPSL in 2008. Only one individual had an alternate date idea (Jul 4-5-6), but several commented they liked the proposed dates for a number of different reasons. So with all that said, we are going to lock in July 31, to August 3, 2008 as the official dates for GPSL 2008.

The extra day did generate a few comments but mostly they centered around what we will do with the extra time. The number one concern being that we didn't just use the extra day to spread out what we already do. At this point Thursday, July 31 is tentatively to be used as a static display and workshop day. We hope to have displays from NOAA, FAA, CAP, NASA, Garmin, and others, if you have a display or workshop you would like to propose or do yourself please let me know. If you have other ideas about Thursday and I can think of a bunch, let me know that too.

Proposed:
July 31 -- Static Displays, Workshops, astronomy night?
Aug 01 -- Conference presentations, flight briefing
Aug 02 -- Launch, recovery, debrief
Aug 03 -- Weather Date, departure

Location is our next assignment, now that the dates are locked it will be much easier for us to find the host site for the event. Please visit nearspaceventures.com/gpsl2008/ from time to time and watch your e-Mail for updates on this and other details about next year.

If you would like to help with GPSL 2008 in almost any capacity, please contact me and I'll put you to work....trust me.

Our goals for 2008 are lofty, as they should be given what we do (launch high altitude balloons) and we are going to work hard to make this the best GPSL ever. This is a tall order, given that year after year the quality of the conference has gotten better and better, and last years was such a run-away success it will be doubly hard to beat. So aim high, stay in touch, keep an eye on the web site, put the dates on your calendar and grab hold of something....we're about to take you 20 miles up.

Kansas City or Burst!

3632. GPSL 2008 Workshop ideas

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-04 18:42:37 UTC
From: wb8elk@aol.com
Topic: 3632 Message: 3632

Those dates will work for me as well....I can also do some Workshop sessions as well....Sounds like a good use of the extra day if there's enough interest in doing this.

Some topics that come to mind that I could help with and I'm sure there would be others who can volunteer for some of these ideas:

- Bringing Near Space to the classroom (experiment ideas and electronic sensors - how to get schools involved)....can range from elementary to college level).

- Balloon Tracking 101:
(Hands-on DF demo and Foxhunt - build your own low power tracking beacon)
(How to setup and use various APRS programs for balloons)
(Flight Path prediction how-to: Balloon Track, HYSPLIT, Web-Based Balloon Track, calculating helium fill for ascent rate and parachute calcs for descent rate)

- Payload enclosure design and techniques: (how to build foam-core, attachment and flight train techniques...mechanical considerations - enclosure ideas)

- Power systems for Balloons: (Battery technologies, how to calculate power budget, wiring methods and techniques.)

- Using Zigbee and other low power RF systems for interpayload communications....to include using 900 MHz spread spectrum radios for high-speed data with the ground station and how to set them up.

- Long Duration ballooning how-to: Solar, Zero-pressure and Super-pressure design considerations and how to calculate performance. How-to build your own balloon.

- ATV systems and setup....payload design and hands-on ground station design.

- Bill WB8ELK

I'm planning to use a Beeline 70cm GPS transmitter in my first balloon flight. http://www.bigredbee.com/BeeLineGPS.htm I have the unit as I hope to also use it in another hobby of launching high powered rockets.

I've built a 1/4 wave antenna - nothing fancy, simply a plan from an ARRL book using an SO-239 cabinet connector. I've ground tested it with a Beeline RDF transmitter to about three miles and still had a good signal. Beyond that the terrain and the trees got in the way. My problem is that I'm in realtively flat Iowa and can't think of a good way to get some real, quality range testing short of an actual balloon flight. Any ideas?

I'd really rather not risk my transmiiters and cameras on a HAB flight without testing the antenna.

Thanks,

Pete

Fly the Beeline on a nice big kite. :) That is my suggestion. Be sure to use some good strong line (like dacron). Also pick a nice stable kite (not a stunter). Delta-Conyne are decent lifters and pretty stable.

Unless you get a very big kite you probably won't be able to lift the entire package but the beeline is pretty light if I remember right. I fly a 7 foot Delta-Conyne that carries a light digital camera. I would probably look at something in the 9 foot range for the Beeline (depending on your antenna).

I don't know if there would be a problem with building up a charge on such a flight. I have heard something about kite lifted antenna building up static. You might want to look here:
http://www.wireservices.com/n9zrt/live-wire/events/marconi/kitefaq.html
for advice. I would think that if you limit airflow around the antenna (like mount it behind the kite - it might help reduce the static buildup). Just a guess there though. Study up before you try anything.

Keep us informed about how the beeline performs. It is a very interesting device.

Good luck
Brek - KC0YOE

3643. Kites for testing payloads and parachutes

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-06 05:15:43 UTC
From: wb8elk@aol.com
Topic: 3643 Message: 3643

I fly a 14-foot Delta-Conyne kite (Sun Oak kites)....it can lift several pounds and I have had it up 1000 feet or more....just remember that you'll need a lot more kite string than that to get it to such heights and be careful not to overfly power lines for high flights since if the wind does die out, it'll come down faster than you can wind in the string unless you have a motor-powered winder. I'd recommend starting out with just a few hundred feet at first and about 400 feet up ought to be sufficient for a range test.

The kite I use is listed as the 14-foot Compound kite on their website:

http://www.sunoaktradingpost.com/compoundsnow.html
(http://www.sunoaktradingpost.com/compoundsnow.html)

With a good wind, you can probably carry up a useful payload with their smaller 9-foot Delta-Conyne as well.

It's an extremely stable kite and can handle a wide range of wind conditions. It's extremely easy to assemble it and it rolls up into a compact space.

I've flown ATV with live camera and had reports out to 50 miles from it....so that would be a good test. A kite is also a good way to test out drop tests of new payload, parachute or glider designs.

I'd recommend braided kite string...at least 250 pound test for that large of a kite. With several hundred feet of kite string, you'll find that it's a good idea to rig up a kite winder....I use one of those garden hose winders that has wheels on it and hold it down with sand bags. I've seen some folks rig up an electric motor-powered winder as well.

I replaced the wood spars on the kite with carbon fiber tubing which allows me to lift an additional pound or two of payload.

Some more kite resources....this is a good source for kite and BALLOON string:

I use their Crankmaster Reel (highly recommended) for my big kite when not using my garden hose winder.

_http://www.intothewind.com/shop/Line_and_Accessories/Bulk_Line_and_Reels_for_Traditional_Kites_ (http://www.intothewind.com/shop/Line_and_Accessories/Bulk_Line_and_Reels_for_Traditional_Kites)

Also....for balloons and kites....you might want to consider Paracord which comes in a variety of colors....I forget where I got my last batch of this stuff, but found a place that does a variety of colored paracord on the internet:

http://www.vtarmynavy.com/para-cord.htm (http://www.vtarmynavy.com/para-cord.htm)

Bill and the group,

There are very good winders on the market, if you have 40 dollars or more.

However, there is a very superior winder that is cheap. It is plastic with steel bearings and is smooth as silk, winds fast and comes in 3 sizes. The smaller size holds 650 feet of 30 pound test. The larger sizes hold much more.

I bought one from a US distributor and liked it so much I bought 2 more!

Here is a picture of it, look at the blue winder at the bottom of the page. Your hand grips in the center of the hub and you wind the outside of the reel with a handle that folds in when not in use. The little gizmo that protrudes at about 4 o clock in the photo is the eyelet that the line threads through.

http://www.airdynamics.co.uk/chinese_accessories.html

My 10 year old daughter loves them too!

If anyone is interested, I can look up the US distributor if you like.

Regards,

Art

Hi Guys,

Here's a neat pix of the Mar 1991 EOSS-2 landing just NW of Ft Collins CO.
This was perhaps the first of many PBC messes that eventually led up
to the fast release device. The girl in photo is Slate N0TQN's daughter,
I assume; she's 16 years older now (so am I, come to think of it).

I don't recall ever seeing a blue parachute, despite the fact that EOSS-2
was the first EOSS launch that I participated in; I'm a bit more
observant now :=}.

Hey Paul,

Give credit to the Thunderidge HS principal who drafted that tag onto
EOSS back in our salad days on EOSS-3(?) IIRC. Rick N0KKZ has the details.

Eliot Young of SWRI might have some ideas how to get NASABucks for
such projects.

3649. New Column

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-10 14:08:23 UTC
From: PAUL VERHAGE
Topic: 3502 Message: 3649

Okay, the new column is finally started. You can read it online at, http://www.sas.org/tcs/

My next goal is to get more people designing BalloonSats. I hope we can set up a process where people can arrange to get them launched.

So issues I need to resolve....

What kind of cost should be involved with helping people launch experiments? Could we charge per pound of payload and how much? As amateurs, we can't make money with radio, but we could at least take care of our costs.

I suspect members would not want to see the GPSL email list become a place where schools and amateurs ask for a near space lift. Is that right? I could set up another email list if necessary. Would current ARHAB groups be interested in subscribing top that list and helping launch?

I'd also like to get other ideas.

Thanks everyone,
Paul

Dear Colleagues,

Regarding compensation, I took the liberty to contact my friend Chris Imlay, W3KD, ARRL's FCC attorney. Here is his answer to my question; both appearing below:

Hi Chris,

I thought that I would ask the expert on the question of compensation. A group of hams who are helium balloon satellite ethusiasts are wanting to assist others in launching payloads on their balloons. Their understanding is that they can only be compensated for reimbursement of expenses involved in the launch. My question concerns whether or not the FCC prohibition regarding compensation covers launching balloons and/or reimbursing automobile drivers for gas expenses for their chase vehicles.

Thank you for your assistance.

Chris' response:

Offhand, I think neither case constitutes a violation of Section 97.113. That rule section refers to communications for hire or for material compensation, direct or indirect. So the question, really is what is being reimbursed. If it is not communications being furnished for money, it is not prohibited compensation. In your example, it would seem to me that what is being furnished is not communications, but rather balloon launches and chase vehicles for balloons. This is aside from the question of whether or not reimbursement of expenses constitutes "compensation". There is an argument that it does, but here, it is not reimbursement provided for the expenses of buying a radio, or for an antenna, or something directly related to the Amateur Radio communications. It is, rather for something completely unrelated to the communications; furnishing a chase vehicle for balloon recovery or for the cost of launching a balloon which incidentally carries amateur radio equipment is
not really the type of circumstance that Section 97.113 was intended to prevent.

The FCC takes a rather strict interpretation of the rules, so as to provide maximum flexibility. Section 97.113 was formerly a very strict rule, but it was liberalized some years ago to facilitate experimentation in the Amateur Service.

Just a heads up that articles for the Fall 2007 issue of Amateur Television Quarterly will be due October 1st.

Tell us about what your local group has been doing this summer.

Have you built anything recently? Write about it!

Worked some good ATV DX? Write about it!

Worked ATV mobile this summer? Write about it!

Used ATV in a balloon? Write about it!

Well, you get the idea. Share your ATV experiences with others through Amateur Television Quarterly. Others will enjoy what you have to say.

Thanks to all who have done so in the past.

Hi Paul,

EOSS has worked out an agreement with the organizations that we fly for
to reimburse us on a per-flight basis for the actual cost of latex and
gas, plus a percentage margin to cover other expendables, such as
lift line, batteries, portapotty rental, etc. And most agree to
reimburse mileage at the IRS charitable rate for folks who participate in
the flight, including mileage to fetch and return He bottles.

Where multiple organizations fly the same day, we prorate even steven.

Now, for "customers" who are as poor as we, like Boy Scouts, we do it
pro bono and fill out unused payload weight budget with our new payloads
that need flight quals.

73 de Mike W5VSI, EOSS

PS: It seems I'm registered twice on GPSL - and only one showed up
when I updated my email address. The other still uses my obsolescent
attglobal.net address and will start bouncing when I terminate that
service. Not sure who administers this group, and hope he notices
this addendum.

3663. Antenna Testing Question

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-04 00:08:57 UTC
From: Pete Lilja
Topic: 3663 Message: 3663

I'm planning to use a Beeline 70cm GPS transmitter in my first balloon flight. http://www.bigredbee.com/BeeLineGPS.htm I have the unit as I hope to also use it in another hobby of launching high powered rockets.

I've built a 1/4 wave antenna - nothing fancy, simply a plan from an ARRL book using an SO-239 cabinet connector. I've ground tested it with a Beeline RDF transmitter to about three miles and still had a good signal. Beyond that the terrain the trees got in the way. My problem is that I'm in realtively flat Iowa and can't think of a good way to get some real, quality range testing short of an actual balloon flight. Any ideas?

I'd really rather not risk my transmiiters and cameras on a HAB flight without testing the antenna.

Thanks,

Pete

Pete,

how about turn the power way down, figure out your limits with the reduced power, then scale up the distance mathematically with increased power? Just a thought.

(BTW, we got 20 miles line of site using the stock antenna on the BeeLine, home made 6-element yagi, and TH-D7 receiver)

Realistically, I think you're gonna have to fly it, or move out of Iowa ;)

Hi Pete,

From what I can tell from the datasheet, the BigRedBee has a power output of approx 16 milliwatts (as long as you set it up on your config program to output the max power of 12 dBm).

I ran some pathloss calculations and under ideal conditions (line of sight) and a sensitive UHF ground station with preamp, you could possibly get 35 miles to a car with a mobile whip antenna, but probably more like 20 miles in practice. With a small yagi, you could possibly be able to hear it out to about 90 miles depending on your elevation angle....beyond that, you'd probably need a high gain yagi (14db gain or more). I'd recommend putting a preamp in line as well....I use the Advanced Receiver P432VDG - but be careful not to transmit into it. During one of KC8UCH's flights, he flew one of the BigRedBee's and I know some reports were from about 70 miles or so out, but the reporting station I know about was using a 15 dB gain antenna up about 80 feet at the time. I've flown 50 milliwatt 2 meter transmitters and they have been heard out to 400 miles at the noise level by stations with gain antennas....with the additional pathloss for the higher 440 band frequency combined with the lower power on the Big Red Bee, your range will be less than that. Keep in mind that you'll also want some fade margin above the noise level to get a good packet decode.

This would work great during the Summer months where the balloon stays pretty close in....but as you get further towards Fall and Winter, you can drift 100 to 200 miles downrange. Also, be aware that unless you have a ground station act as an internet packet gateway, you won't be hitting any digipeaters or showing up on the Internet on FindU.

Perhaps Greg K7RKT could tell you if there is an amplifier module option to boost the power?...I'd estimate that a 10 dB boost in power would work great for longer distance balloon flights.

I've experimented with the chip used on this for low power balloon beacons.....the Texas Instruments CC1050....it's a great chip that covers between 300 to 1000 MHz and can tune in 250 hz steps.....if anyone knows of something similar for the 2 meter bands, let me know...the closest I can think of for 2m are the chips by ICS but they are a pain to set up the frequency. Those chips are on the 2m beacons I use...Harry KC5TRB uses one of their chips (the fixed multiplier version) for his tracking beacon kit.

Byonics sells a 5watt (!) amplifier for the MicroTrak that think will work very well -- just need to get some time to make the changes necessary on my end and do some testing. I don't think I'll get the full 5 watts, but 2-3 should be possible.

That's the same one I using for the BeeLine products-- agreed -- nice chip. I've had it up and running at both 433 and 900 Mhz.

> .if anyone knows of something similar for the 2 meter bands, let me know

Check out the ADF7012 from analog devices. 50 Mhz to1 Ghz, +13dBm (I think). I've got a couple of 2 meter prototypes up and running, just need to get the output impedance matching network taken care of. It should also work nicely with the MicroAmp.

3668. Idea for APRS buoy

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-12 17:17:42 UTC
From: mconner1@gmail.com
Topic: 3668 Message: 3668

This is a follow-on to some traffic on the APRSSIG and to KC8UCH's "buoy" from a couple weeks ago.....

Here's an approach I hadn't thought of for an APRS buoy to get it a little more reach. Use a balloon to hoist an antenna and lightweight feedline to a higher altitude (say, 50 or 100 ft) to increase its range over the water. The radio and battery could remain in a sealed package floating on the surface. You could make a fairly simple antenna by folding the coax braid back over the sheath for 1/4 wavelength, then attaching the balloon to the end of the center conductor.

I think you could do this with a modest-sized balloon, perhaps made of Mylar or something more durable than latex. Obviously the wind would tend to pull it along rather than just the water currents.

Now whether this would be considered a hazard to wildlife or water navigation is left as an exercise for the reader. It'd probably attract a lot of attention on the busier lakes. :)

There's also the possibility of multiple bouys, and possibly things
like suspending the antenna (and radio?) from a balloon tethered to
the bouy (or maybe I'm thinking of just an anchor!) if this is for an
event of some kind (I'd make at least the radio part floatable, and
design it so that when the balloon comes down the antenna will be at
least slightly above the water to make recovery easier).

The biggest risk re flying a new beacon on a live ARHAB flight
isn't the radio range - that can be calculated easily using the
standard radar range equation (see ARRL handbook). The larger
risk is whether it will survive the low ambient temps, and
to a lesser extent, barometric pressure, plus the rigors of
PBC and a parachute drag.

If it still operates after cold-soaking in a zero F food freezer
for a few hours and after being kicked down a flight or two of
concrete stairs, then it's likely to live thru the flight. Another
new-payload bugaboo is EMC: if RF from the xmtr gets into the low
level sigs in the beacon generator or GPS; but that problem typically
shows up during terrestrial testing. Oh, and make sure the GPS will
keep a lock when its lying on its side looking north.

Dear All,
We are trying to execute a weather balloon experiment much like what
ANSR has done. We are finding it much more difficult than we imagined
when put the project together in concept. I'd like to talk to people
who have been involved in the ANSR effort, or others, that could help
us along in executing this project. Please respond to this email
address or email me at natestruth@...
<mailto:natestruth%40hotmail.com>. I can also be reached at
914-693-0031 after 4:00 PM EDT for voice communication. Thanks so much.

If you launched with this "pibal" inflated, then if it didn't
burst at altitude, it would tend to float above the parachute
during descent making for an .... ummm ... expedient descent. And
if it landed on land vice water, then it would also tend to drag
the payload string until it snagged or something broke off - at
which time, it could be lightly loaded enough to fly again.

This has happened.

Oscar KP4RF uses trash bags and duct tape to make his payloads
buoyant, and has executed a number of successful maritime recoveries
offshore from Puerto Rico.

Check out the crossband repeater on www.eoss.org under the Hardware
button for WB4ETT's very effective self-erecting 2m gain ground
plane. Only downside is that the antenna must be tail-end-charlie
on the flight string.

Well thats the way it goes this past summer Im use to it sence I am running every experiment and launch over the Atlantic anyway .But the number one thing Ive learnt as we have lost 13 over the big pond that.EACH ONE IS SPECAIL AND EACH HAS HAD SOME FUN FROM EACH HAM that checks it out on that day of lift offs . We might loose them but as each takes off and in the air for up too a few hours every Ham that participated from check ins to tracking to listening to watching at he farm feild to events we've done. Every one has had fun and includeing myself. And every experiment goes well for further study to the next. Ive had 265 HAMS in New England that has given there smiles and best wishes and told storys how they felt they was a part of the projects each time. And even a father that blame me of his daughter and him getting there Ham tickets due to they was scanner listeners and I have gave the excitement for them to study and test and past. And several older Hams who has said there hobby was going stale and with the excitement Ive brough to New england has made them check out other modes now and check into the specail net I have on sunday nite. and learn digital modes to that. I guess I canpat myself some on the back but because of the good world of amatuer operators I have to give them credit for also in ther participateing into our launches for I remend every one its just like the ole days of NASA rocket launches YOU FEEL YOUR THERE and a part of the EOSRED TEAM.(NASA MOVE OVER). And thats my Number one goal young and OLD and whatever else YOUR THERE feel it and check into our net for EOSRED MAINE high Altitude Balloon research and studys and Developements to the EDGE OF SPACE.

And it was a good honor to meet yourself and others at the GPSL WE had FUN and learning experience and cant wiat to join you all again.

3676. Re: Idea for APRS buoy-- EOSRED we due a 2nd balloon

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-13 03:22:53 UTC
From: lt
Topic: 3668 Message: 3676

We do a second balloon and its filled with only half as much heluim
and we use a parachute on the upside down position. And candy
lifesavers for chute and string release in the water.

Yes we have found the second balloon for us at 50 foot above the
main balloon acts as a bobber in the water and we've had a tune
fisherman 85 miles out in the atlantic find it floating from a
distance.
The chute upside down position gives a slower lift off and when
the winds gets a hold it then its on the way. and when the main
chute pops then the package flipps to a 180 degree angle for its
return to earth.

The candy life savers is placed in specail release areas so in the
water they desolve and the package seperates to floating and the
rest sinks with seaweed.

Ive been doing research on this with over 20 launches some in the
atlantic still.

Possible when a whale burps up my other packges they will be
recovered and each has a 50 dollar reward for there return.Thats why
the whale has not burp them up yet what can he do with 50 bucks(HE-
HE).

I hope this give you soem ideas.

Agreed. I have every confidence in the Beeline hardware set. These things are built for and fly often in high powered rockets. HPRocketry is a much more violent application than a balloon flight. I think that qualifies for being kicked down a couple of flights of stairs! 8-)

The Beeline GPS transmitters have also flown successfully on a couple of HAB flights I've read about.

Mt concern is for the antenna I built and I'm finding it difficult to test. However, I've been offered space on others' balloon flights so this problem may be solved.

If anyone is interested in high power rockets there is a lot of info. online. Here are a couple of links to some onboard video of mine.

I'm watching the video.

curious, does the video look better at the mission control?

Or what are they actually using for the video?

or what is the purpose for the video.

is it to see details in the envelope?

if so i hope the images at the site are better. because the ones i'm seeing streaming here are terrible. You can see the balloon, but thats it, no details at all of any kind.

Ahhh,, it's the sun

That explains the lack of detail. the sun is pretty plain lately.

And then if it's the sun

then this is a pretty good image. stability wise. some decent
magnification going on here. looking like close to 100X or so by my guess.

They have several cameras available and switch occasionally.
The position has not updated on the internet for several hours.

Any idea what system they are using for tracking?

I saw a presentation on that airframe at the LCANS conference in
Boulder this spring. It's about 1000 lb - plus payloads! No
wonder they're using a 3,500,000 cuft ZP balloon.

"Things should be made as light as possible, but not more so"
(w/ apologies to my hero Albert).

OK. I was going from the "Autumn campaign" bit on the stratocat.com.ar
page where it mentioned the 37H balloon (3.7 million cuft). I was
off by a factor of 0.3!! I wonder who's paying the tab for this one.

73 de Mike W5VSI, EOSS

BTW, it's 0348Z, and it's still flying. I suspect they won't cut
it down over the mountains - makes for a dicey landing and recovery.
Probably gonna aim for Jack's QTH :-}.

3705. 1200g Kaysam (Kaymont?) balloons on eBay

Yahoo group: GPSL (2002 — 2008)
Date: 2007-09-17 03:35:06 UTC
From: Mark Conner
Topic: 3705 Message: 3705

There have been fairly regular listings for 1200g balloons that were manufactured around 9/03 on eBay the last week or so. I've gotten a couple myself. They're put up every 3 days, and the seller is willing to combine shipping if want to wait a couple of auctions' worth.

The listing and box say Kaysam, but if they're the same batch that were gov't surplus on eBay earlier in the year, they're actually Kaymont.

73 de Mark N9XTN

Kaymont is the US distributor for the Japanese Kaysam latex balloons.
Confusing, eh?

If the balloons were stored in the original poly bags and sealed
cartons (light tight), then they oughta be good as new.

> Confusing, eh?

I thought haysam was a USA based and made balloons UGLY BROWN oblong
just plain nasty and with the large knott ring thing near the neck
thing. When the Japanese balloons (Totex) started coming out they were
nice round, tight and much better quality. then Kaysam shortly went
under.

or at least thats how i remember it.

Hi Joe,

Yeah, you're right. Kaymont distributes the Totex line of latex,
but the SKU for those are all "KCI-xxx" - which rattled me into
thinking Kaysam. I think Totex uses natural latex and Kaysam used
neoprene. Funny, tho, that the natural stuff looks so nice and
white uniform compared to the manmade stuff. Maybe higher quality
manufacturing processes?

We've relied on Merle all these years to handle balloon ordering,
and since his accident in April, I've just placed 2 orders, both
with Paul Fetkowitz at Kaymont.

I think the ones on eBay are Totex. They should be the white-colored one-piece ones, without the cardboard collar at the neck. The box photo and NSN match what got earlier in the year, but won't know 100% for sure until the shipment arrives.

I bought one for about $22 and the other for $12, plus something like $20 for shipping the pair (awaiting final invoice), so that's roughly $27 per balloon which is less than half price. I got a big batch of these balloons earlier this year from another eBay supplier and they were perfect - no discoloration at all.

You can find it on eBay by entering "Kaysam" or "weather balloon" for your search term. I see these come up every few months, so a slug of them must be going through the gov't surplus channels. I haven't paid full price for balloons for over a year now.

Mike, did Kaymont require a minimum order (qty or cost)?

Hi Mark,

Sounds like you've found some great bargains on E^&*.

Paul happily shipped me 2 @ KCI-1200's the same week that I
posted my order to him via email. Merle had established a sound
working relationship with Kaymont, so I'm not sure that service
would extend to all players. Give it a shot.

Hi Joe,

The mantra that I must repeat to myself when the alarm goes off at zero-dark-30 every launch morning is, "I do this for recreation. I do this for ..."

Seriously, my motivator is hearing the cheers from the students when they see their creations soar towards the edge of space from the launch site and their grins and giggles when they pick them up at the landing site.

It's those times that I reminisce about all the neat goodies I found to tinker with in my grandpa's and uncles' garages - things largely denied today's youth.

If it weren't for that, I'd have gone into a more thrilling hobby, like stamp collecting, after the first 100 launches.

I'm passing on this Balloon Launch Announcement for Bill Brown WB8ELK as he is out of reach of an internet connection:
- Barry N4MSJ

Launch site: Perryton, TX
Launch time: 3:08pm CDT (today)

APRS: 144.39MHz WB8ELK-11
Voice Beacon: 147.42MHz "WB8ELK"
10M CW Beacon: 28.322MHz

http://www.findu.com/cgi-bin/find.cgi?wb8elk-11

Chase vehicle: KC5TRB-2:
http://www.findu.com/cgi-bin/find.cgi?kc5trb-2

Note: ORB did not fly

Hi Mike,, Yeah to me it looks like evening launch

America's Challenge Gas Balloon Race Launch presented by Matheson Tri-Gas
Balloon Fiesta Park
10/8 6:00pm - 7:00pm
America's Challenge Gas Balloon Race: The America's Challenge is one of the most prestigious long-distance ballooning events in the world, and gives spectators a means to learn about another aspect of ballooning - long-duration gas balloon flight. Most Balloon Fiesta events feature hot-air balloons, which usually can stay aloft for only a couple of hours. Gas balloons, use lighter-than-air gases such as helium and hydrogen for lift, and can stay aloft for 60 hours or more. The balloon that flies the furthest - in accordance with the rules - wins. Some America's Challenge flights reach Canada and the U.S. East Coast. The gas balloons inflate in the late afternoon and take off in the early evening - timing that increases the balloons' flight duration.

should be cool,, i wonder what altitudes they will be flying at/

The gas balloonists like to launch at sunset to delay having to vent gas for as long as possible. Solar heating during the next day can take 'em above the open gondola altitude limit of 15K' MSL, where they have to vent. The next night, they have to dump ballast to stay in the air. When they run out of ballast, for them, the race is over next afternoon.

Hi everyone:

My wife Angie and I took and passed out General license exams today. :) We are feeling pretty good about that and wanted to share the news with the group.

Regarding balloon news, we have been asked to speak to the Hot Springs South Dakota Amateur Radio Club about ballooning. At one time there was going to be a CD or DVD about GPSL 2007. Did it get finished? If I could get a copy, it would be nice to share with the Hot Springs Club. :)

Congratulations to you and Angie on your new HF privileges!

I haven't gotten around to finishing up the GPSL disc...it ended up on the back burner because of vacation, home improvements, among other things. I was hoping another group or two might contribute some of their photos, data, etc., but I think I've got what I'm going to get. It won't be a formal presentation, but just a collection of what's been uploaded to the GPSL ftp site. I could probably burn something to a disc for you sometime this week, or if you'd like, you could download the contents of the ftp site and burn one yourself.

You're welcome to join us at 6:30 central time every evening on 3.982 MHz for the Nebraska Storm Net. I'm net control on Mondays.

Again, congratulation to you both on your achievement!

Roger KCØMWM

Subject: [GPSL] News to share

Hi everyone:

My wife Angie and I took and passed out General license exams today. :) We are feeling pretty good about that and wanted to share the news with the group.

Regarding balloon news, we have been asked to speak to the Hot Springs South Dakota Amateur Radio Club about ballooning. At one time there was going to be a CD or DVD about GPSL 2007. Did it get finished? If I could get a copy, it would be nice to share with the Hot Springs Club. :)

Hey, congratulations to you and Angie! Nicely done, folks. Now I expect you'll be budgeting some of your balloonacy bucks to get on HF, right? Hope your QTH isn't in antenna-whiner land.

I just did a ppt presentation for the QCWA last week, and I could email you that - it's about 6 megs, and I could also zip it. It just covers ARHAB history and development to date with emphasis on use of ham radio. There's a bit of EOSS-specific stuff in there, plus a link to Bill Brown's YouTube video of his first flight in '87.

http://www.balloonfiesta.com/Gas/tracking/

Interesting race tactics at work already. Two balloons are sticking close to ABQ this morning, presumably to catch more favorable winds than if they had gone north to Colorado.

The more northern group should turn easterly today, coming into northwestern Kansas/southwestern Nebraska tonight. I haven't run detailed predictions to see exactly where they might go, however.

They have APRS trackers on 144.39 with callsigns K5GAS-*.

Thanks Roger.

Don't go to any trouble. I can FTP the content that is there.

Brek.

Roger Hammond <rahammond@...> wrote:
Congratulations to you and Angie on your new HF privileges!

I haven't gotten around to finishing up the GPSL disc...it ended up on the back burner because of vacation, home improvements, among other things. I was hoping another group or two might contribute some of their photos, data, etc., but I think I've got what I'm going to get. It won't be a formal presentation, but just a collection of what's been uploaded to the GPSL ftp site. I could probably burn something to a disc for you sometime this week, or if you'd like, you could download the contents of the ftp site and burn one yourself.

You're welcome to join us at 6:30 central time every evening on 3.982 MHz for the Nebraska Storm Net. I'm net control on Mondays.

Again, congratulation to you both on your achievement!

AC-3 cancelled prior to launch.

Also, there was a note last night around 11pm that they were having trouble updating the balloonfiesta.com tracking website. It's possible they get updated posits by non-APRS means, so the findu.com and balloonfiesta.com maps won't always match.

No, that thing about the tracking was posted either at the top of the tracking page or was buried in one of the press releases - I can't remember which.

End of this race is going to be very interesting. The AC-1 crew headed north through the Nebraska panhandle has evidently had to stay low today in order to do that (winds low are from the south, higher up from the WNW). When they cool off tonight, they may well have to land unless they have a lot of ballast. Appears AC-7 tried to stay low this morning but couldn't and is now behind AC-2. AC-2 may be high enough that if they can get through tonight, they could win if AC-1 has to land this evening. I think AC-8 is out of the running unless they can go well into tomorrow - it almost seems they had a problem gaining any altitude at all.

I forecasted for one of the AC teams last year (Critelli/MacNutt), which was a lot of fun. One of they guys here at work forecasted for AC-5 this year. He said most of the teams that landed in CO had to do so last night as they couldn't get over the Continental Divide at night. AC-5 hoped to stay a bit farther west and end up around Rawlins but just couldn't get the wind right to stay far enough west.

Some of the teams that opted to go up the western slope of the Rockies ended
up landing in some pretty rough-looking territory. Not sure how they're
gonna get back down off some of those ridges.

From: Richard Rucker <rrucker@...>
Subject: [QCWA] Elmering 4th & 5th graders in "near space"
applications of amateur radio

The following is about an after-school science program, Near Space
Explorers (NSE), started this year by Matt Nowinski whose daughter is
one of the students. Details are found here:

http://nearspace.dyndns.org:8080/

Matt and the kids are now planning to develop an experiment to be
carried aloft by a future balloon launch by the Vienna Wireless
Society. Its website can be found here:

http://www.viennawireless.org/

More on VWS's past balloon flights can be found here:

http://www.viennawireless.org/balloon/index.php

I learned about this great idea via the following email message. I
trust you will be as intrigued by this idea as I am.

3736. One gas balloon still aloft

Last report in FindU is from about 1215Z, but they're in a sparse area for APRS. I was amazed to see they were still airborne this morning - I figured they would have landed last evening too. Passing 60 hours of being aloft.

73 de Mark N9XTN

6:01am Thu, 10/11
Subject: Last Balloon Still Flying In America’s Challenge
Headline: Cayton Crosses Into Canada
Web: BalloonFiesta.com

As day breaks over the U.S. Canadian border, the last America’s Challenge Gas Race balloon still aloft is headed into the Canadian province of Saskatchawan.

Andy Cayton and Stuart Enloe (Team 1) have been streaking northward in the fastest winds seen during the entire race, in excess of 30 mph. They are already the apparent winners, having flown twice as far as any other competitor, and have been aloft more than 59 hours.

The second place team of Barbara Fricke and Peter Cuneo (Team 2) and the third place team, Gerald Stuerzlinger and Helmut Meierhofer (Team 8), both landed late yesterday afternoon.

The race isn’t over, of course, until the last balloon lands safely. It is now morning in the Great Plains, making it easier for the pilots to select a landing site when they are ready to end their flight.

You can follow Cayton and Enloe’s progress today via live tracking on the Balloon Fiesta Web site, www.balloonfiesta.com.

Looks like AC-1 has finally landed in Saskatchewan after 1054 miles of flight.
Betcha they're kinda tuckered out, eh?

Could very likely have been one of the 70 or so NWS radiosondes that the NWS launches twice daily all over CONUS. Based on your 0040Z observation, it coulda been a 0000Z RAOB bursting low.

The big scientific stuff flown by NASA out of Palestine TX and Ft Sumner NM are plastics, and they don't burst - they vent the fill gas thru a hole near the top.

Gene,

How have you been? Just wanted to drop you a quick note that Ryan and I will be doing a JOTA event at Camp Lakota in Woodstock next weekend. It will be held in conjunction with a Webelos Weekend event. We will have a chance to introduce ~200 scouts and their parents to amateur radio.

We will be integrating ATV into the program in the form of a remote control truck running an ATV transmitter. Not that this is revolutionary. If you are looking for some news for your next edition, please come out and pay us a visit.

Hope to see you there.

Hi Joe,

I think you're right about that one going "superpressure", and if so, then considering that party balloons are filled nearly to capacity, then it would have gone into float at a pretty low altitude, I'm guessing. That would be the altitude where the mass air it displaced equaled the mass of the full balloon and gas.

Might be interesting to strap a pico APRS beacon on one to see what it does :=}. A true high-altitude superpressure is likely beyond ARHAB means.

The party balloon superpressure experiment is something a couple of us here are considering soon....basically a whole bunch of the larger mylar party balloons from Target with a lightweight APRS....my guess is that they don't go more than a few thousand feet up before leveling out.

ORB-1 thru ORB-4 were 4 foot party balloons with simple can oscillators, so we did not get real-time altitude. I did however get time and approx. elev. in deg. from several DFing chase members. With that info I was able to estimate that the balloons went somewhere between 15,000 ft and 30,000 feet.

3743. ARBONET-2 Launch Announcement

Yahoo group: GPSL (2002 — 2008)
Date: 2007-10-14 20:40:34 UTC
From: Doug Loughmiller
Topic: 3743 Message: 3743

ARBONET-2 High Altitude Balloon Flight Set for an October 20th Launch

Members of the ARBONET (Amateur Radio Balloons Over NorthEast Texas) organization are making final preparations for the October 20th launch of ARBONET-2. Originally scheduled for launch last spring, ARBONET-2 is being dedicated to the memory of Kim R. Miles, N9IS SK, a long time contributor to the central Indiana Windtrax Amateur Radio High Altitude Balloon team who passed away March 27th at the age of 51.

ARBONET-2 will be launched from the JD Trissell Airport in Clarksville, TX which is located in the northeast corner of the Lone Star State. Launch time is scheduled for 9:30 AM CDT on Saturday October 20th. Current winds aloft forecasts indicate the ground track of the flight will carry the amateur payloads towards the Texas - Louisiana state line. If ARBONET-2 reaches its expected altitude of 96,000 ft, radio amateurs in parts of as many as seven states should be able to monitor the beacons and communicate through the cross band repeater onboard the near space vehicle.

The compliment of payloads aboard ARBONET-2 includes:

A plain language homing beacon that will transmit navigation data to the ground on 146.560 MHz in plain English thus allowing anyone with a scanner or 2 meter hand-held in the coverage zone to follow the progress of the flight without the need for additional equipment to process the data.

An APRS beacon operating on 144.390 MHz to report vehicle location data throughout the duration of the flight and to aid in the recovery of the packages following descent.

A 70 cm Up / 2 meter Down Cross band FM repeater (445.800MHz Up 147.560 MHz Down) will support two way communications during the duration of the ARBONET-2 flight.

A 10 meter CW beacon experiment produced by the Richardson Wireless Klub, K5RWK will transmit a 500 milliwatt signal on 28.061 MHZ.

In addition, ARBONET-2 will carry a number of secondary payloads that will perform remote data collection functions for analysis once the payloads are recovered. These payloads include a 4 mega pixel digital camera configured to capture images every 30 seconds through the duration of the flight, a self contained balloon burst video system designed to capture images of the balloon burst event and other environmental data loggers.

Operators are encouraged to submit reception reports from the ARBONET-2 flight to team members via the ARBONET web site: www.arbonet.net <http://www.arbonet.net/> . A special commemorative QSL card will be made available to everyone who submits reception reports to the ARBONET team.

An ARBONET Launch Information HF net will be held on 3.910 MHz (+/- 10 KHz) beginning at 9:00 AM CDT to report the progress of flight preparations and to provide real time coverage of the expected two and a half hour flight.

The ARBONET team encourages radio amateurs throughout the flight's coverage zone to make use of the payloads aboard ARBONET-2.

Additional updates will be posted to the ARBONET web site in the days leading up to the mission. In the event weather conditions cause a postponement of the launch, the next launch attempt is scheduled for the following Saturday, October 27th.

3744. Trans Atlantic flight rules proposal

Yahoo group: GPSL (2002 — 2008)
Date: 2007-10-15 16:05:45 UTC
From: Ralph Wallio, W0RPK
Topic: 3744 Message: 3744

There are projects underway by multiple groups for transatlantic flight attempts as early as this
winter. I propose we bestow honors on those groups that make valid attempts and bestow more significant honors when the battle is finally won.

I propose the following conditions and rules to validate attempts by groups that wish to participate
in this endeavor:

1] Plastic Balloons, whether zero-pressure or super-pressure, must be designed and fabricated by
members of the group. A given member may not participate in multiple groups but free informal
consulting is allowed. (Use of stock manufactured latex or equivalent sounding balloons, e.g.,
boost and main, would be allowed.)

2] Successful received and reported periodic position reporting must not exceed 2-hour intervals
and -has to be- via Ham Radio licensing, frequencies, modes, etc.

3] The floating phase of flights must be above 60,000ftASL (above controlled airspace). Floating
phase starts when ascent stops the first time after launch.

4] Flights can be launched from anywhere west of 60dW longitude with the ultimate goal of landing
on dry land east of 15dW longitude (or the small portion of the African coast that is slightly west
of 15dW).

5] Flights will be declared valid attempts after floating a minimum of 1,000mi -and- transiting
over international Atlantic ocean waters.

6] All technology, tricks, fantastic ideas, et al., used for valid attempts has to be in the public
domain and thoroughly discussed in group web pages.

I echo Robert's comments on Rule #3. At the same time, however, we should encourage the avoidance of jet altitudes especially when the track would parallel the commonly used north Atlantic jet routes. A 40kft floater that were to cross the Atlantic at say 35 deg N would be less problematic than one heading northeast from Boston. Perhaps we can mark off certain areas/altitude ranges of the Atlantic as being "no-fly" areas for the record.

Is Rule #1 necessary, especially when latex balloons are exempted? I doubt anyone is going to use a commercially-produced balloon for this effort due to cost and the fact the prime supplier is unlikely to sell to a hobbyist, but I see no particular reason that one individual or group couldn't produce a plastic balloon for another to fly.

Ralph,

As always, thanks for thinking about and putting together good flight ideas. Just a few comments.

Rule #1 - It would make it difficult for a number of groups that rely on the one or two other people that build balloons. I like to build payloads, but don't have the experience or desire to melt plastic into a balloon shape. As long as everyone gets credit, that is what should count.

2. I like the two hour reporting interval, but HF is the only mode that will work across the water. I don't know of many groups that have flown a GPS based HF beacon. It might be nice to be able to use a non-ham mode as well. At least for a backup.

3. I'll echo the same comments as the previous guys. I'd like to float down lower and in faster air. Avoiding the cross routes makes good planning.

4/5. For the West groups (ANSR/EOSS), we'll be starting at 100+dW. If we fly from Arizona/Colorado to waters off the US coast, does that count? Although that really isn't trans-atlantic. But still a good 1500 miles run.

6. Time to finish up the HF beacon....

I like most of these rules,
seem a good fit..

two things i'd like to add, (maybe?)

Some sort of a scoring thing, to keep track of each flight.. so even the
not successful crossings, or BAD luck winds days still count for
something, or even the flights of recent from the tennessee boys,
like, as you said
"

"The floating phase of flights must be above 60,000ftASL (above controlled airspace).
Floating
phase starts when ascent stops the first time after launch."

A timer starts when "Floating Phase Starts"
And the location is noted at this point also.

Final "Score" is, time in minutes from float to touchdown (Or loss of signal) times miles
traveled from position of float start to again either touchdown, or loss of signal.

what's everyone think?

Joe & NSS

NSS-45 "October Skies" T-8 days and counting.

Hi Robert,

I'm guessing that Ralph proposed rule #3 not as a form of self-flagelleation but rather in the interest of being a "good neighbor" in international civil airspace. Note that FAR 101 only applies to the US National Airspace, and its exempt limits are rather liberal compared, e.g., to Canada's. Not sure about other nations, but one possible reason that we don't hear about any ARHAB activity from the UK is that the UK "FAA" and "FCC" prohibit use of ham radio aboard ANY aircraft, balloons included, regardless of size.

Those country-specific issues aside, the 60,000' MSL ceiling is rather broadly recognized as "no man's land" for civil air traffic, however.

In reading thru some of Space Data's US patents, I learned about the Grand-daddy of derelicts - a ZP out of Canada that went deaf & dumb heading out over the Atlantic. ALL air traffic across the northern Atlantic corridor was rerouted for 10 days until the derelict was located. Which may explain in part why Canada's rules are so restrictive.

Another such incident would spell doom for ARHAB everywhere. Let's not commit suicide, OK?

Mike,

I very much respect your opinion on this, but I do not believe that the HUGE derelict to which you're referring (it was over a million cubic feet, IIRC) is in any way comparable to a FAR 101 exempt flight. Not even close - and no air traffic is going to be rerouted around a 125 cubic foot balloon with a 10 oz payload, nor need it be!

I'm not proposing suicide - I'm only suggesting that the rules be reasonable, not cautious to the point of stupid. We're talking about flying a balloon across one of the most uninhabitated parts of the planet - an OCEAN. Is there air traffic? Yes. But it's a big sky up there and we're talking about very, very tiny targets - and these targets (our balloons) will do less damage than a fat pigeon if a collision occurs.

Again, I respect your opinion - I *strongly* disagree with you in this case, but I do understand your concern.

As for international regulations - how, for example, would we deal with an ocean-crossing balloon that penetrates British airspace? You use this as your own example of varying regulations - would such a flight be disqualified?

All this aside, I can tell you that a trans-Atlantic flight is coming and coming very soon... I'd love to see it (whether it's mine or not) on Ralph's page, but if "the rules" get in the way then I really don't care.... Anything after that will be, in the words of Don Piccard, a record achieved by "parting your hair on the other side".

73,
Robert

There's a company in India which recently got into the met and scientific balloon business. I couldn't learn much more about it, but my guess is they wouldn't have any problem selling anything to anyone who had the Rupees.

Space Data uses valved latex with ballast drops to keep their flying cell sites in the stratosphere for at least 3 days. They do make their own balloons, however, with some magic to hold off UV degradation. I think they bought Kaysam's facility.

mconner1@... wrote:
> I echo Robert's comments on Rule #3. At the same time, however, we should encourage the avoidance of jet altitudes especially when the track would parallel the commonly used north Atlantic jet routes. A 40kft floater that were to cross the Atlantic at say 35 deg N would be less problematic than one heading northeast from Boston. Perhaps we can mark off certain areas/altitude ranges of the Atlantic as being "no-fly" areas for the record.
>

Hi Robert,

I may be way wrong, but I really doubt that one could stay exempt with a payload that can survive a multi-day trans-Atlantic crossing and still meet the 2-hr max beaconing interval. There's battery weight, heater, etc to consider, plus ballast if it's a ZP or valved latex.

The airspace over the N Atlantic is heavily inhabited by civil aviation traveling between CONUS and EU, especially between 35 and 40K'. Iceland and Greenland have plenty of overflights.

Yeah, it's a big sky every where. But we've had PIREPS called on visuals to our balloons - even tho they were 40 miles from the aircraft. It doesn't take a midair to screw things up - a hard avoidance maneuver during cabin service, whether necessary or not, could mollux it for all of us. And woe be unto he who does!

Another international consideration is permission to transmit on the ham bands within the various national boundaries. The CEPT license is valid only when accompanied by the operator's passport. Not mine, babe! Space Data takes special care to go QRT before crossing the US border; but they operate under a commercial US license.

And if you run a ham transmitter from a balloon inside UK airspace, you'll be in violation of their laws. Poor form, old chap. Poor form.

As an example of the kind of hoops one must hurldle, consider that Bill WB8ELK had to sail out into the Gulf in order to launch his rockoon.

All I'm saying is that if we're gonna do this and honor folks with public accolades, let's be sure it's done safely and legally.

Regarding air traffic over the Atlantic, we may be able to act as a peer in the system, and not just an unexpected hazard to navigation. While the FAA rules do refer to manned craft, pilots are well familiar with the right-of-way in the air - you shall give way to the less maneuverable craft (including lighter-than-air craft).

Aircraft travelling oceanic routes are in excellent communication with Air Traffic Control, as well as with aircraft in the vicinity of them. Oceanic flights fly on published (daily) organized North Atlantic Tracks. They split the traffic up like a highway, with eastbound tracks following the jet stream, and the westbound tracks well clear of the jet stream, usually to the north. ATC coordinates flight plans, and then the actual flight's actions, to avoid collisions and maximize efficiency of the airspace. Aircraft are frequently out of range for ATC's radar, and are required to radio their position in very frequently for large portions of the trip. ATC therefore has the easy capability of plotting Altitude/LAT/LON/ speed/heading position reports.

Perhaps we could use the airspace responsibly as if we were private pilots, as we are not that different in speed from small general aviation planes using the same airspace as the commercial jets - the airspace control systems are designed to accommodate both high and low speed traffic by virtue of the continual flow of information between all parties involved. Looking at EOSS's fine published work with their local regional ATC Center, and their live updating FAA info page, this works admirably well already.

With tools like HYSPLIT available to most of us, we can create a fairly good flight plan, even format it like an oceanic flight would, as a series of regular position waypoints, for easy ATC digestion. Just like the commercial traffic, we can check in with ATC every so often with the latest position report (many groups do this already via phone to local towers) and ATC will far in advance adjust an airliner course ever so slightly so they pass around us, just like a slower fellow airplane.

Whether ATC will go along probably depends upon our professionalism and reliability in reporting to them.

What do you guys think?

Thanks,
Dan

3757. Transatlantic Rules and the start of the race.

Yahoo group: GPSL (2002 — 2008)
Date: 2007-10-16 15:14:22 UTC
From: K. Mark Caviezel
Topic: 3757 Message: 3757

Ralph:
Thanks for putting those draft rules together and sharing them with the community.

As many of you know, I have been building plastic balloons for some time with some excellent successes:
a). two flight with over 150 lbs payload,
b). numerous flights to over 100k feet,
c). one flight in excess of 1000 miles flight distance.

The rules you propose make an already difficult endeavor significantly more difficult. For any successful group to have its achievement undermined or discredited because they were not in compliance with all of these rules would be a shame.

I propose significant simplification: a winning flight be defined as one that makes a launch from the north American continent, overflies the Atlantic and makes a landing on land on the other side.

Additional embedded comments follow:

1] Plastic Balloons, whether zero-pressure or super-pressure, must be designed and fabricated by members of the group. A given member may not participate in multiple groups but free informal consulting is allowed. (Use of stock manufactured latex or equivalent sounding balloons, e.g., boost and main, would be allowed.)
>>>>>>> What is the rationale and motivation and presumed value of this rule? We wouldn't consider requiring the radio equipment, string, wire or batteries to be homebuilt- would we?

2] Successful received and reported periodic position reporting must not exceed 2-hour intervals and -has to be- via Ham Radio licensing, frequencies, modes, etc.
>>>>>>>>>>> I'd like to list this as a recommendation, not as a requirement. The excellent flight and ANSR 33 last year demonstrated a great flight, but with the night time position reports blacked out due to changing propagation. A lightweight VHF/single band HF unit will be smaller,

lighter, cheaper, and more likely to work properly than a fancy multi-band, band-hopping super gizmo (I think).

3] The floating phase of flights must be above 60,000ftASL (above controlled airspace). Floating phase starts when ascent stops the first time after launch.
>>>>>>>>>> If this is adopted as a requirement, it will drive balloon size up, transit time up, speed down, required battery weight up, payload weights will be greater, costs will be higher, and the possibility of doing a sub-12 pound FAA part 101 exempt style mission is reduced. Since a sub-12 pound FAA part 101 exempt style mission is 'in family' with the estimated FOUR MILLION US National Weather Service balloons that have been flown without serious incident in the last 40 years, I respectfully submit that the exposure and risk of some small ARHAB balloons in far less congested airspace is so very low as as to be acceptable by any reasonable estimation of the risks.

5] Flights will be declared valid attempts after floating a minimum of 1,000mi -and- transiting over international Atlantic ocean waters.
>>>>>>> What is the rationale and motivation and presumed value of this rule?

I'll be supporting the UTARC team and Bill WB8ELK in their own transatlantic flight attempts this season. Both parties have mentioned intention to fly an armada of small balloons until success is achieved. In their prior flights, they both have demonstrated 'the right stuff' in spades and I'll wish them the best in their attempts.

If anyone has a starter's pistol- you can fire it now. I am mailing a transatlantic suitable 920 cubic foot balloon to UTARC today.

best regards,

- Mark Caviezel

Hi Dan,

Hey, thanks for the kind words about EOSS's FAA internet-based reports. We owe Russ KB0TVJ a mess of thanks for mothering that concept into reality - not to mention findu's Steve Dimse.

Out here in Denver ARTCC's area, both center and TRACON controller have adopted use of our APRS beacons I-gated into findu.com, using a special cgi script that converts the positions into radial and range from the user's selected VOR. They like it so much that they REQUIRE us to ensure that our beacons are I-gated! Sure beats the 2-hour interval phone calls, and even the position reports at specified altitude penetrations that were SOP not so long ago. Of course, they'd really prefer that we fly a transponder, but we've explained our objections to the weight and QRM problems that would entail. And recently, Norm Kjome told me that the FAA asked U Wyo to STOP using Mode C altitude reporting, since since that caused the balloon to disappear from the scopes entirely when it passed out of the filter limits for the sector it was in.

Now, of course, they ignore us while we're above FL600 and below 18K' if we're over 20 miles from DIA.

Nonetheless, ARTCC also requires us to time-slot our launches if our trajectory falls anywhere near the DIA approach and departure corridors out 40 - 60 nm. One of those slotting rules stipulates that we don't don't our two-fers closer than 45 minutes apart, so they only have to track one balloon in the heavy corridors at a time. Another is that we should be back on the deck preferably by 1000 local, and NLT 1030 local, to avoid the high-volume DIA traffic. There are earlier and later slots available, but daylight and surface winds pretty much rule those out.

So yeah, if we hang out above FL600 and/or I-gate thru findu, AND all the airspace controllers along the route agree to use the findu reports, then we can be "good neighbors" in trans-Atlantic airspace. That's no easy trick, since we had to do some training with Denver ARTCC just to get to first base; other centers may have adopted that scheme with local ARHAB groups, but I've not yet heard any solid confirmation that they have.

EOSS has worked hard to develop a working relationship with our local FAA folks. It's taken time and plenty of flights, as well as a "Yes sir, yes sir, two bags full" attitude to get there, but it's paid off in the form of blanket COAs for our ordinary heavies.

The next trick is to develop APRS beacons that can reliably hit I-gates 24/7 for the duration of the flight. Do-able, yes, but no mean feat. It's been done using PSK31 on 20m and 10m for a day or so, I think, but not with 100% copy.

And another trick would be to get hitched into the jet stream, and certainly OUT of the summer upper easterlies! But the jet stream's altitude goes well below FL600 in the winter. So it might be necessary to develop some form of altitude control, just like manned balloons (and Space Data) do.

This "Gas-X" prize (ya like that one :=P?) is a worthy pursuit. But its award should be subject to an extraordinary set of rules, along the lines of what Ralph proposes, that reflect the complexity of international ops and to ensure that all the safety and legal I's are crossed and T's dotted.

Thanks, Luis

So it was a 1998 ZP intended to fly just 1 day which suffered a failure of the cutdown / termination system. Although not mentioned on the web page, it's likely that the beacon batteries died not long into its 9 day flight. So I guess the Canadian and US interceptors who tried to shoot it down found it using dead-reckoning from upper wind reports.

Not sure who got nicked for the price of the flight hours, but I, for one, would not care to speculate on what the threshold size might be to prompt a military response to a derelict. And it's for sure that I'd be hard-pressed to pay for more than one flight hour of an F16!, not to mention the extra fuel used diverting civil aircraft.

Just one system failure -- who'd have guessed? Seems they didn't have a redundant timer-based cutdown per FAR 101.35(a)(1)&(2), or if they did, then they weren't totally redundant. Shades of EOSS-6 :={.

Note that Luis's web page also gives the size of the balloon - 328,500
cubic meters, or over 11,500,000 cubic feet!

(That's TEN THOUSAND TIMES larger than the *largest* superpressure
envelope that I'm considering for a trans-oceanic flight!)

I draw the line at the point of exemption under FAR 101. No ambiguity there and no one is making up the rules (including me) - simply let FAR 101 be our guide.

As I've said over and over, I very much respect the added caution that EOSS exercises - it is a wonderful and noble thing. I also agree with your general approach of discouraging tropospheric flights amongst amateur groups. For example, if the goal of any given ARHAB group doesn't explicitly require a tropospheric flight, then I think that we should, as a community, encourage them to clear controlled air space as quickly as possible.

In most cases, ARHAB groups are using latex balloons that result in quick up-and-down flights anyway, so the issue is generally moot. Some of us, however, are working on designs that are purpose-built to fly in the troposphere - and we do so legally under FAR 101.

While I agree with the EOSS approach in general, I do not believe that the added caution (in the form of discouraging tropo flights) makes sense in ALL situations, most especially not in the case of a trans-oceanic flight. To claim safety as the issue is, in my humble opinion, either the result of statistical ignorance or intellectual dishonesty (I prefer to think the former). The exemptions of FAR 101 were not dreamt up by someone in their basement late at night, they were based on millions of combined man-years of experience involving aircraft of all kinds - enormous amounts of real-world data and hypothetical scenarios all distilled down into a set of rules that *work*, day in and day out.

Some may think the position that I and others take on this matter is arrogant, as if we know better than all of our ARHAB colleagues who have been doing this decades. I think the case is quite the contrary - to presume that the FARs are somehow inadequate and that we, as amateur radio operators who have sent up perhaps a thousand balloons across all of our combined missions, must instead invent our own draconian rules to safeguard all of aviation is the most arrogant position of all!

If that sounds particularly unpleasant in its tone, I apologize... It is not intended to be so. I do, however, vehemently disagree with the proposed "rules" and what I believe to be the flawed reasoning behind them.

Perhaps we will need to agree to disagree on this matter. If the rules stand as drafted, it will make no difference to me, nor do I believe it will alter the plans of Mark, Bill, the UTARC group or anyone else who is seriously considering the challenge of a trans-oceanic flight.

I would like to see the first ARHAB flight to cross the ocean acknowledged on Ralph's page. But if that's not to be, if instead the "first" as recorded there will be a flight constrained by arbitrary and statistically invalid "safety rules", then so be it. The international media attention that the first crossing will receive will surely dwarf our little ARHAB world anyway, and the state of the art in amateur ballooning will march on, with or without the recognition of the ARHAB community itself.

Topic: 3766 Message: 3766

With regard to the proposed 60,000 minimum altitude for a trans-oceanic flight, I offer this example...

What if I were to obtain a waiver from the FAA to fly a 20lb payload at FL 200? Would such a flight be disqualified because it did not remain above FL 600?

I think that most would answer, "no, it would qualify because you had a waiver - that makes it alright". If so, then why would a flight that is specifically exempted by FAR 101 not be treated the same way - i.e., as long as it's legal, it qualifies?

How would a non-exempt flight with a waiver (and perhaps ATC coordination and all else that would be required to fly under the waiver) be different from an exempt flight (which, according to the FAA, requires none of this)?

I draw the line at the point of exemption under FAR
101. No ambiguity
there and no one is making up the rules (including me)
- simply let
FAR 101 be our guide.

>>>> excellent points, Robert. Thanks for sharing
them with the group.
I do advocate compliance with the FAA part 101
requirements (exempt or non-exempt) for all groups.
Also, I require FAA part 101 compliance for all
flights I operate. Additionally I do encourage- when
possible and practical- reduction in the areal
ballistic coefficient of the payload packages. This
is easy and painless to do- bulk up the payloads with
styrofoam.
This also provides thermal insulation and reduction of
mechanical shock to the payload should the parachute
'squid' and provide an express trip down to the
surface.

best regards,

Hi Robert,

To start, FAR 101 is simply the starting point for FAA's authority, not a limit. Note that the 101.7 "Catch 22" clause has been used to limit ARHAB operations in the past, and can be expected to be invoked towards any operator who thumbs nose at limitations imposed that are more restrictive than those stipulated by FAR 101.

And second, FAR 101's applicability ends at the boundaries of the US NAS. Since this thread involves international flight, limiting our scope to FAR 101 simply doesn't cut it. Crossing into Canadian airspace with a balloon larger than 115 cu ft and no waiver is a violation.

It appears that you and Mark Caviezel rely a lot on the "big sky" concept, along with an expectation that trouble ensues only if one gets caught. Now, I can't dispute the reasonableness of either of those approaches from an entirely statistical point of view. However, I cast that kind of thinking in the same class as justifying regularly busting the speed limit on the highway. By and by, there'll be a bust, and fingers crossed, it won't include charges for vehicular homicide.

Each launch does invoke a small, but finite, risk of damage or injury to others. In the event that Murphy succeeds in one of those rare events, then one is faced with defending his actions to mitigate the magnitude of a jury award. EOSS has yet to find an underwriter for that risk, other than Lloyd's of London with absurd premiums. So we've decided that our best defense is to demonstrate a clear lack of negligence through abiding all possible precautions, including notifying the FAA of where we are so that they can manage flight separation. So far, I know of no one in ARHAB who act to avoid a mid-air, even if they could see it coming.

The quid pro quo is that we agree to fly within the FAA's special provisions, including cutting down in the event things get out of hand. Yes, some of those special provisions are a pain in the rear, but EOSS considers it a reasonable cost of using the NAS for our purposes. A nice side effect of nurturing a healthy working relationship with the FAA is that they have granted us some leeway that would otherwise be flat denied. Another is that we can apply for an annual blanket COA with a few minutes of editing a boiler-plate 7711-2.

None of those benefits will accrue to a flight which launched with no notice whatever to the FAA. In these cases, the operator is relying on the Big Sky and a beneficent Murphy.

Anyway, that's where EOSS draws its line, and we do encourage other groups to adopt similar procedures. But not out of some morbid urge to share the

pain, but rather as an effort to avoid having even more draconian rules being imposed by law on all ARHAB operations in the wake of an avoidable God Forbid accident. Witness the new UAV rules, e.g.

And rest assured that EOSS didn't "invent" the Special Provisions that we've chosen to conform to. They come entirely from the FAA. And yeah, it would be nice to launch at will, but not at the risk, however small, of an accident that sends us into bankruptcy or jail, results in serious injury or death or spells doom for the entire ARHAB community.

Do as you wish, sir. But please don't mollux it for the rest of us. If you do, then don't expect our accolades, either.

> restrictive than those stipulated by FAR 101.
>

Certainly FAR 101 is the starting point - but it was written broadly
for a reason. The key to your paragraph above is, "...who thumbs nose
at limitations imposed that are more restrictive than those
stipulated..." - who has suggested such a thing? Surely not me. If
FAA decides to impose more restrictive limitations, then we will
follow them. I'm quite certain that I speak for most groups when I
say this. No one is suggesting flaunting the law.

(I can only hope that you would not follow in the footsteps of G.
Harry Stine and his one-man campaign back in the '60s to squash all
amateur rocketry other than what he deemed "safe". Not sure if that's
where you're going with the "more restrictive" stipulations or not...)

> And second, FAR 101's applicability ends at the boundaries of

At least on the Canadian part of the argument, it seems that you
didn't have the conversation that I finally had with a gentleman at
Transport Canada back in March. They have no problem with a payload
that is exempt under U.S. regs crossing into Canada.

And if you're suggesting compliance with all possible jurisdictions
which might become involved in such a flight, then you're suggesting
the impossible. If that's the case, then Ralph shouldn't post the
contest at all - it will end like the CATS Prize and its ridiculous
requirements imposed by FedGov.

Actually, it's not at all the same. In fact, I drive the speed limit all the time and do my best to obey all laws (and I'm involved in some highly regulated activities - exempt ballooning not being one of them). Instead, it's about understanding the reality of the situation and rejecting a purely emotional response to it. Perhaps I shouldn't drive an automobile at all - not even at the posted speed limit - because I MIGHT have a heart attack and cause a chain-reaction accident on the freeway, killing tens of people. Could it happen? Sure. Is it at all likely? No. Should I change my behaviour because of the remote possibility? Hardly. Still, I'll drive the speed limit.

Do you fly exempt flights? Does FAA *require* you to follow the same protocol for these flights? And if, by chance, the answer is "yes" to both of these - how exactly did this come about? FAA showed up on the flying field one day and said, "you need to do x, y and z" - or did it happen some other way?

> None of those benefits will accrue to a flight which launched with no
> notice whatever to the FAA. In these cases, the operator is relying on

No, one is relying on the LAW as implemented in FAR 101.

Show me the FARs that covered UAVs *before* the new rules... UAVs as
we know them now didn't exist in the past and so appropriate rules
also didn't exist. Free balloons are the oldest man-made flying
machines in the world and the rules for them are fully matured.
Still, FAR 101 and its exemption exists - and for a reason!

>

Again, how did they come from the FAA?? Did you ASK for special
rules? Or did they show up one day? Or do they really only apply to
non-exempt flights?

> Do as you wish, sir. But please don't mollux it for the rest of us. If

You need have no such worries... Nor need anyone worry that I will
"play NASA" when I'm really only flying an exempt balloon.

I think the FL600+ proposed requirement is actually a simplifying factor, rather than a barrier, since that's probably the upper limit of all controlled airspace both domestically and internationally.

Now, once again, a COA from the FAA won't be worth the paper its written on once you leave US airspace.

And if you were to apply for a COA to fly 20# at FL200, then you should expect to have a set of Special Provisions attached to your COA if it were awarded. There are over 10 on ours, and one is a requirement I-gate our APRS beacons into findu.com at regular intervals. Another requires us to file a HiBal with ARTCC, TRACON and FSS detailing the forecast trajectory - and if that trajectory passes near heavy corridors, ARTCC can limit our launch window. You COA would probably require a HiBal as well, and if your trajectory would carry you thru Class B airspace, plan a scub.

Going transatlantic at normal enroute altitudes, then you'd have to deal with all the other national airspaces that you'd be penetrating, and probably with ICAO in international airspace. So designing your flight to stay above 60K' will most likely save you a world of headaches getting clearances all along the route. Note also that some countries won't permit overflight under ANY circumstances. IIRC, Steve Fossett had to steer around Liberia during one of his circumnavigation attempts.

Yes, a transatlantic ARHAB flight would be quite an accomplishment, and it won't be easy. But doing it high will be logistically simpler, IMHO.

Ah, that was when we had the payload hooked up to a GPS simulator
(http://gpsfeed.sourceforge.net) for developing the live status
page, we had to have real data going through the APRS system to test it.

We successfully tested out rocket guided JATO pack strapped to the side
of the box.

:-)

Actually, one of our contributors (Ben Bales) developed some software to
test our payload with GPS telemetry coords being fed into the package
since we were inside a building and, rather than take the whole package
outside, simply feed GPS coords via the computer to test the data
stream. We set up a perimeter around our actual location just keep
people in Oklahoma or Yokohama from wondering what was going on.

We had out APRS station setup set to i-gate, so we could check via FindU.

I agree, well done webpage and well done flight so far. I've really enjoyed keeping up with it. I zoomed in on Knoxville and didn't see a loop around the city. I suppose there is a time window on the displayed track and the old testing data has dropped off the screen.

What I want to know is how did you build in a "state line" guidance system??? First it picked up the Kentucky/Virginia state line, followed that until it ran out, then turned to the east to pick up the West Virginia/Virginia line and resumed the NE course of that line. Hmmm...

3782. Find Me Spot low cost GlobalStar satellite tracking unit (more info)

Yahoo group: GPSL (2002 — 2008)
Date: 2007-10-26 22:27:16 UTC
From: wb8elk@aol.com
Topic: 3782 Message: 3782

I talked to the folks at Find Me Spot.....here's some preliminary details:

http://www.findmespot.com (http://www.findmespot.com)

Unit price (uses AA batteries) - $159.99
Service plan (yearly subscription cost): $99.99/yr
Unlimited continuous tracking feature (SPOTcasting): $49.99/yr additional.

If you have subscribed to the unlimited continuous tracking service, once you turn on the unit through a button press or two, it will update it's position via the GlobalStar satellite network and show a position on their website every 10 minutes.

I didn't get an answer if they will also show the altitude on the web link.

Not much more info on their website other than the girl I talked to said it can be purchased directly from them...or through Best Buy, Home Depot, Ace Hardware and a bunch of other retail outlets starting on November 1st.

Although it's unknown whether the unit will work above 60,000 feet (they state 21,000 feet max - guess we'll have to fly one to find out for sure), it still could be viable for lower altitude, long duration flights.

GlobalStar itself sells a line of satellite modems, but they are extremely pricey.

More details when I find out more,

- Bill WB8ELK

Hi Bill,

Sounds like a neat, but pricey, solution for the newbie one-person launch/recovery team or the recovery-challenged. I, for merely one, prefer to use ham radio, howsomever. That 21K' alt limit won't help for in-flight tracking; I wonder if it simply gives up reporting, yields bogus GGA, or breaks above 21K'.

That is dirt cheap. What is the cost of a radio, GPS, and APRS in the balloon and then another radio/APRS on the ground? Plus all the labor hours to build a custom payload, test it, configure, etc. And then half time the radio doesn't transmit, or it always reports the launch location without updating, or the TinyTrack goes out to lunch. With Bill's device you put in a set of AA batteries and turn it on. You'll get position reports on your cell phone in real-time.

It will track over 60K' at less than 1000 knots. The usual COCOM limits.

Hi Mike,

Depends on how long you intend to use it.

The core AE0SS-11 module has been in regular service for 10 years and
over 90 flights. The "cheap" SPOT service would be $999 alone.

Radio: DJ-C5: $45 at hamfest
GPS: Rockwell Jupiter $25 EPAy
GPS Ant: Micropulse quad helix: $9
TNC: KPC-3+ $90

Total: $170 + $3/flight for LiSO2 batts

I'll consider the ground station end a wash, since I already own the
radio, TNC and 'puter for other stuff.

'SS works every time, and reports every 30 sec up to 130K', plus telemeters
Vbatt, internal and outside air temp and baro pressure every 1 -2 minutes.
And its reports appear at FAA control floors as VOR radial/range.

THAT's dirt cheap.

I plan to purchase one and see if we can answer the question of whether it works after traversing 60k feet....Even if it hangs up after going above 60k, as long as it pops back to life on the descent, I can see this as great insurance for a backup landing location tracker....particularly in those more remote areas of the US where the payload is not within earshot of digipeaters....although the real challenge is what it'll do in the Bermuda Triangle.

I would agree that you can't beat surplus APRS tracking costs. However, while seemingly expensive in the long run vs. APRS when you factor in the yearly subscription rates.....the unit cost is actually cheaper that buying a new radio, APRS board and GPS. I see that they also list a monthly rate program, so perhaps they will allow subscriptions a month at a time.....of course, you might want to factor in that after using it in a balloon flight, you can still use it to track wayward teenagers, husbands or wives or use it as it was intended for mountaineering.

But when you compare it against other GlobalStar and other satellite radio modems and usage fees...it's dirt cheap....just check out GlobalStar's offering lineup of satellite modems and associated subscription/data fees and you'll see.

Hi Joe,

Nice video! Could you tell us more about your "anti-spin" technology?
Seems to work pretty well.

We gave up on trying to fly a GPS in the same payload as 70cm AM ATV -
the pulsatile 3rd harmonic just wipes out the GPS signal before it gets
to the antenna. In our latest version, we have a GPS with Zigbee master
in one module and a Zigbee rcvr and on-screen overlay in the ATV; works
well.

How big was your 'chute and payload? A big 'chute with a light payload
is less likely to oscillate, since the dynamic pressure under the canopy
is relatively low and thus produces less reaction force when the bubble
leaks out under the skirt asymmetrically. Of course, you know the downside,
especially for a winter flight!

Hi Mike,

Mike Manes wrote:
Hi Joe,

Nice video!
Thanks for the compliment. It was my first try at video editing, and more or less posting on YouTube,,

Could you tell us more about your "anti-spin" technology?
Seems to work pretty well.

Actually it's pretty simple, and adds very little weight. As the video says we tried it oh ten years or so ago, and it did seem to help a lot. so we just took the same idea and took it as far as we could within reassign. here is a picture of the flight from ten years ago,

For the servers lists that don't allow pictures heres a link to the same image on a web site
http://www.qsl.net/wb9sbd/launch-50-50.jpg
It's simple remember when you were a kid, and took your ruler in school and put the center hole on a pencil and kinda made a propeller and spun it around,?

Ok think more on the idea of how hard it was to make it start or stop spinning,, Now instead of the 12" ruler,, use a yard or meter stick. how much harder is it to start or stop? A LOT!!

As seen in the above (or web site) image, this was tested with those arms that were the size of a 10 meter dipole. (we happen to also have the 10 meter beacon ran along it too.)

Anyway, it did seem to help a LOT,, more than ANYTHING we have seen from all our other flights or from anyone else also.

That was the last video flight we had till the one the other day for the school. On this one we stretched that idea by more than 3 DB.

from tip to tip it was longer than a 20 meter dipole, close to 38 FEET. Worked awesome!

We gave up on trying to fly a GPS in the same payload as 70cm AM ATV -
the pulsatile 3rd harmonic just wipes out the GPS signal before it gets
to the antenna.

That we learned also. in our older flights we never had that problem,, but it was stone age GPS systems too,, a old magellan OEM board that was like 6 by 10 inches HUGE! but it worked, the newer ones just may be more prone to the desence?

In our latest version, we have a GPS with Zigbee master
in one module and a Zigbee rcvr and on-screen overlay in the ATV; works

well.

We were thinking of something similar, or even just a totally separate system just for APRS and other beacons and keep it far away..

How big was your 'chute and payload?

Payload 5.5 Lbs
Chute a true 10 hemispherical shape, not just a circular sheet, but a true 10 feet working diameter.

A big 'chute with a light payload
is less likely to oscillate, since the dynamic pressure under the canopy
is relatively low and thus produces less reaction force when the bubble
leaks out under the skirt asymmetrically.
Had a 12" spill hole in the top center too so that should have helped some with the bubble..

Of course, you know the downside,
especially for a winter flight!

I was actually very surprised at that, not so much as the winds are getting fast,, but the fact even in the thin air it seemed to just hang there,, I really wish the GPS had worked to see what the true rate of fall was,, i was thinking ,, yeah it's gonna be really slow at touchdown but the initial part i was thinking the lack of much dencity it wasn't going to make much difference.

WOW Boy was I wrong there!!

That would be a awesome to you software guru's

Bill made the awesome balltrak,, now we need someone to make a version, that we can input payload weights, and chute diameters, and pop altitudes so it can also crunch the numbers on decent too as well as going up..

yes i know a LOT more complicated,, since the altitude rate of change will be changing depending on altitude, but what a cool program that would be,, hey may as well add a float mode time too he he he..

take care all

Joe & NSS

Howdy Joe,

OK - so it's just a KISS "inertial enhancement" scheme. A lot simpler than our mag compass aimed table - only advantage of the compass it that it's possible to command a desired azimuth - but that's useful only if you have a view out towards the horizon. We have all the hooks necessary to uplink an az and el aiming command - just a'waitin' fer that elusive Round Tuit to cobble a command receiver and decoder into the module.

FB on the 12" vent on the 10' 'chute. Bigger the better. The vent does increase descent rate - but not enough to bring down a 5.5 lb payload fast! We use a 5' chute for all exempt flights.

When we decided to put ATV, APRS and other funtions in separate packages, we gained a LOT of flexibility in configuring payload strings for various missions. No need to work the EMC issues from square one on each flight. Just put 10 or 15 ft of line between the modules, and EMC is history. The only time that didn't work was when we tried a 433 MHz wireless digital link on the same flight string as our 426.25 MHz ATV - duh! We now use 900 MHz for that link.

I'm also considering using 1.2 GHz WBFM for ATV. The constant carrier envelope shouldn't be as invasive as NTSC AM, but there could still be some GPS receiver desense. Yet another Round Tuit job ...

Joe,

That's about the steadiest video I've ever seen from an amateur balloon. The boom method really gangbusters worked for you.

>from tip to tip it was longer than a 20 meter dipole, close to 38
>FEET. Worked awesome!

What the heck was that stick made of if you're counting its weight as part of the 5.5 pounds you mentioned?

> I really wish the GPS had worked to see what the true rate of fall

How was this recovered without GPS?

>Bill made the awesome balltrak,, now we need someone to make a
>version, that we can input payload weights, and chute diameters,
>and pop altitudes so it can also crunch the numbers on descent
>too as well as going up..

Joe, I'm not sure I know what you're looking for in software. Are you looking for software that tells the descent speed for different times into the flight?

Because Rick's Balloon Track for Windows does that internally (computes the descent speed based on parachute size and payload weight for inputs) in order to predict a landing spot. It sounds like you may not employ BT for W because it would have alerted you to how far your mega 10 foot chute would have taken the small 5 pound payload.

Hank

Okay, I had an idea that using the word recovery was a presumption on my part, but what I was going on was the following where I missed the key word "estimated."

> ride up went from launch site to pop location 84 miles down range,,
> from the pop location to the landing spot an estimated 128 miles!

Is it correct that the 84 miles and 128 miles come from some software estimate, or are they best guesses based on terrain showing in the video?

Joe, when you get a chance, please do a short writeup on how you know (or think) where the balloon went. Will teams be going out to try a recovery in the coming days? Hope you can get that payload back before it deteriorates much.

Hank

3793. GOOD video and we too used a huge chute this time

Yahoo group: GPSL (2002 — 2008)
Date: 2007-10-29 12:52:50 UTC
From: L T
Topic: 3793 Message: 3793

Hi Guys just reading the email and We too with the EOS-4Maine project this time launched on Oct 20 th.

The chute was 32 foot once it unfolded during lift off and it was shaped like a square clover leaf witha 3 foot bleed hole shape like a triagle in the middle.

The chute after several ground test from 200 foot drops +- with different payloads showed a good long loft effect and a easy gluid pattern . the bleed hoe as a traigle shape verses a circle did not let a inverted vertex create on the top side useing a lite materal the chute every time for us created a full even envelope opening and the package arrived like a feather .Well its good for slow returns and experimants that need extra soft gentle landings. We tried it this time and used the easterly winds that day on caught the Jet stream at whew the package traveled at speeds up to 165 mph and a steady 130 +mph at 34,000 to 40,000 footheight level. now of coarse all my flights we are useing the chute in a upside down position for the purpose of drag and flight extended time over the water. but this was great and the APRS beacon perfectly from beginning to about 41,000 area but looks like with the surface temperture on the GPS receiver got the wind chill skin effect for the temp drop at the height area and the speed increased the chill and the unit was trying to warm up and the batery was takeing on a lond deep extra drain on the battery and at 41,000 level it froze up. but the balloon was a 1200 gram and filled to 1/3 the amount to barely to gain lift and this package was only 2.5 lbs and it looks as we flew past the boarder to the Bay of fundy. But this time there was over 5,000 people watch this flight and 4,200 + was boyscouts and others was adults and we have made that day not only a good launch and fun and discovery's .But a new HAM and or new weather man and or sceintist or something in the project drew something of a young mind to a adventure to becomeing a new dream of someone when ther e grow up .And yes from years to come Im hopeing to see a future famous people in related subjects and where they came from and hopes to see that MAINER.

And the Launch control net we had did a proffessionel job for flight and lift off and John you met this past summer was ground control and over 75 HAMS listened in and more as we know to enjoy the fun also. And this time we had a great weather man K1WTX and the APRS inflight tracking team N1WJO and KQ1L and suppor team KA1EKS,N1IME N1RY, and ground crew KB1SUD ,W1SK as HF frequency checker and other out ther for this EOS-4 MAINE LAUNCh that made it a success to the next one Comeing.

we'll be posting pictures of the flight on EOSRED yahoogroups site .

Launchsite,,of course Known, Richland Center Wisconsin,
Balloon POP site,, Kown,, two ways,, Via the video knew the city it
was over, and via chase crew , that were in same city watching the
balloon dississappear.,

Chase crews loose firm ground to chase after (Big bunch of water,,
Lake Michigan)

One Digi in Michigan and only one has the payload for over 7 hours all
by itsself, and no other hear it,, means it's on the ground and very
near by this ONE digi,, since any elevation will make it heard by
others, but this ONE and only one heard it all by itself for 7 hours
before death. and it's near Grand Rapids MI.

>Joe, when you get a chance, please do a short writeup on how

Thanks, Nate

The announcement for that flight came across the various balloon
reflectors, and many of us watched the live video from the on-board
camera in real time.

However, there are a BUNCH of linked articles on that site to coverage of
some other really cool BIG near space flights all over the planet, including
a NASA's work on solar balloons.

Joe,

Thanks, I get the picture now of how events transpired.

One more question: does your payload have a phone number
written on it in case a civilian finds it?

3800. 30M listeners?

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-02 14:21:59 UTC
From: Daniel Bowen
Topic: 3800 Message: 3800

Hey Guys,
We're preparing to begin our trans-oceanic attempts this winter using a QRP 30M transmitter, transmitting CW and RTTY. We're looking for volunteers who would be willing to leave your 30M rig connected to your PC for 2-5 days to help monitor the balloon. Mike Coffey, KJ4Z and I have developed a modification to MMTTY that will allow your computer to relay the decoded RTTY back to our server, which will decode it and present it on our live tracking web page. The software, called DTRC, Distributed Tracking and Relay Client, was tested with great success this past spring. All that is required is a Windows 2000 or newer computer with soundcard input connected to your 30M radio, and an internet connection. Broadband is not necessary, as it's just sending text.

Optimal receiving locations would be in the Eastern US, New England, Eastern Canada, Bermuda, Greenland, Iceland, Great Britain, Europe and Western Africa. Those locations would be best, but for now anywhere will do.

We realize that there has been quite a bit of disagreement about how to fly over the ocean safely. We are trying to strike a responsible balance between performance and safety, and will be compromising efficiency, weight and speed somewhat to some extent to achieve these. Both passive and active methods will be employed to allow air traffic to avoid our balloons.

As a quick follow-up: broadband or always-on connectivity would be preferable, as the client needs to communicate frequently with the server, and there is at present no provision for caching information for later transmission. For those who would like to help but would prefer a more old-fashioned method, we will also be transmitting a simplified set of information (lat/long/altitude, primarily) via CW, and would appreciate anyone who copies the balloon submitting that information manually through a form I will place on our web page.

Taylors HALO network is flying on Saturday 11-3-2006
all balloons will be airborn by 10:30AM Indaina time.

Taylor U. KB9ZNZ-10
Minnesota U. KB9ZNZ-4
Valparaiso U. KB9ZNZ-3
St. Paul MN. KB9ZNZ-5
DePauw U. KB9ZNZ-6
Cedarville U. KB9ZNZ-9
Iowa State U. KB0MGO-11
Central IL. KB9ZNZ-2

The crossband repeater will being flying on the Taylor
balloon.

Uplink: 146.46 Downlink: 446.025

Hi Dan,

What 30m freq will you be using? What callsign? What baud rate and serial format? ERP?

Note that with the sunspot cycle as low as it is, skip props will most likely be daytime events only. Overnight tracking may be critical, as this is when the balloon loses the benefit of solar thermal lift - and those beacons are likely to be heard only by near-line-of-sight stations.

Hello Mike,

The frequency will be 10.106, +/- one or two kHz. We will announce the exact frequency closer to launch time. AA4UT/B at 45 baud ITA2 RTTY. ERP is expected to be in the range of 3-5 watts. CW transmissions are at about 12 WPM.

Hope that helps,
73,
Mike

Thanks, Mike

That oughta make for a pretty good HF beacon. I assume you're gonna
be driving a vertical half-wave (48 ft) dipole?

How far out are you from nailing a firm launch date? And what's your
balloon configuration?

that is the recent tx we used on the EOS-4 project and it worked fine the ant we used was 1/4 w and the GPS rec did good unitl it froze up.. Make sure you insulate the receiver. The Package we did got upto 168 mph and the temps was dropping quickly around -71 degrees and 19 GPS got cold and started to draw excess power and killed the battery around 41,300 foot level with that speed and wind chill effect.But the 300mw tx did great.Ive been playing witha few others on free float gluiders and there preformace is good. We had one burn out after 16 hours with 12.2 volts. Keep it at 8-9 volts and it doesnt heat up as fast.

great time this summer and glad to meet you all.

I hope you don't mean that it got a wind chill from the 168 MPh wind speed,, but that it was just at a very cold level and the ambient air temp was -71 degrees, because be the winds 50 MPh, or 200 MPh,, to the balloon it's still zero wind speed, there is no wind relative to the balloon true?

>and 19 GPS
>got cold and started to draw excess power and killed the battery
>around 41,300 foot level with that speed and wind chill effect.

Oops,, should have read further,, COLD yes,, but unless the balloon has popped,, no matter what the wind speed is, the balloon is going the same speed, so no wind chill..

Hi Lee,

Sometimes a little waste heat is a good thing. Tough to balance it against
conducted heat loss and hot spots due to lack of free convection cooling,
especially for long-duration flights, however. Lots of insulation with
a thermostatic vent to let in cold ambient air if things get too hot may
be a practical solution.

BTW, there was no attm't re your antenna.

3811. Thirteen balloons in the air today

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-03 21:26:41 UTC
From: wb8elk@aol.com
Topic: 3811 Message: 3811

Thought you'd all enjoy seeing a Findu map of the 13 balloons that were in the air this Saturday Nov. 3rd....at least the 13 I know about....Zoom out to a view of the whole USA to see all the balloons on the Google Map.

http://www.findu.com/cgi-bin/find.cgi?call=KB9ZNZ-2,KB9ZNZ-3,KB9ZNZ-4,KB9ZNZ-5,KB9ZNZ-6,KB9ZNZ-9,KB9ZNZ-10,kb0mgq-11,N0OY-11,KD7LMO-11,k9GP-10,K3ZGO-11,N0RNB-1
(http://www.findu.com/cgi-bin/find.cgi?call=KB9ZNZ-2,KB9ZNZ-3,KB9ZNZ-4,KB9ZNZ-5,KB9ZNZ-6,KB9ZNZ-9,KB9ZNZ-10,kb0mgq-11,N0OY-11,KD7LMO-11,k9GP-10,K3ZGO-11,N0RNB-1)

I discovered the unannounced Idaho State U Rise program's balloon (K9GP-10 and K3ZGO-11) while looking at the APRS-IS VHF propagation map and noticed a "strange" band opening over Idaho....the other strange band openings were over the midwest with the HALO balloons, as well as Kansas and Arizona.

Thanks Ryan, that setup sounds great. You can download the DTRC
software from our website: http://balloon.utarc.org. A warning
however, the software WILL be updated before the next flight, and you
will need to download the latest version before the flight. We
encourage you and anyone else to download it and play with it, it
should decode the ARRL nightly bulletins with no software changes if
your radio is set up correctly I think. We will send you an email
when a newer version is available, and also watch the mission status
page for updates:
http://www.utarc.org/wiki/index.php/Icarus_X_Status
Thanks,
Dan

From: L T
Topic: 3819 Message: 3819

Well 1/4 w antennna yes we used this this time in a upside down position and with disk 18.5 inches to form its ground plane above the package it worked great direct contact for more than 90 miles. at 300 mw of power for the microtracker.

the temp sensor on outer package showed we was at a fast drop of temperture during its accent and fast travel with the Jetstream the inside temp also showed a drop in temp at the altitude and travel the pressure inside the package confirmed what we saw and there is a skin effect of temperture and wind chill .the package had a vent release of a postive pressure but it seemed it opened in the winds or movement of traveling at such a high speed of travel . so the vent opened and the air temp drop could clearly been seen as we watch this one travel. Next package will have a protection over the vent release. the parachute was seen after take off unfolding to a 32 foot diameter shape like a digital cloverleaf looks which was the main factor of the flight to see how the chute would at as a KITE and it did perfectly we also had full veiw for over 45 minutes with eyes and scopes in the witnessing of the unfolding and the chute fully opened it was the fantastic scene of the day
picture perfect.

we will use a microtracker 300watt one again but with bouy type antenna mount to set upright in the water. The antenna this next one will also be a wire dipole 1/2wave and a ater timer release once its in the water. so package seperates from chute and strings in the water.

Next summer we'll be launching 5 balloons together with each its own cut of release to extend its flight also useing the chute as discribe earlier for drag and speed and return.

Hi Mark,

Those pix were very nice - and it's alarming how much latex was left
hanging on the parachute's apex - PBC for sure!

You might be interested in the ATV frame shots of the burst of EOSS-30 at:

http://www.eoss.org/ansrecap/ar_030/recap30c.htm

That flight flew in May '97, long before we figured out how to dump the
shards ASAP.

Bill:
Come to think, combining Field Day ballooning with the
2nd annual "International Solar Balloon Day" may be a
good match. Field day is pretty close to the summer
solstice, all day flights should be good and long.
We've yet to gather interest from southern hemisphere
hams, thus negating the need for a ISBD on the
southern hemisphere summer solstice. Unlike a short
duration latex flight, an all day solar balloon
provides a serious platform for communications
purposes.

All interested parties are invited to join the yahoo
group solar balloon forum.

best regards,

- Mark ng0x

Topic: 3812 Message: 3827

Sounds great to me! How about this Saturday? Just kidding. It's just that this past Saturday was my first chance to even listen in on a balloon flight and I heard 3 different balloons. I'm sort of excited about this stuff.

I was again watching the incredible video from the flight linked at the bottom of the page here: http://www.depauw.edu/acad/physics/base/pages/BASE18.asp with the volume turned up. I noticed what I'd call a 'rubbing' sound of probably suspensions lines and quick links. Then the balloon bursts with no sound but more mechanical sounds becomes audible during PBC. Is there not enough air to transmit sound at 100,000'? Are any sounds conducted only through solid material at that altitude? I'm curious and surprised.

From: Pete Lilja
Topic: 3829 Message: 3829

Thanks, Paul. While I've been reading about HABing since the Spring of this year (when I first learned of it) I hadn't read about nor considered a lack of sound at these altitudes.

I'm in Iowa. And I've been in contact with the folks at Iowa State and some other local flyers. I hope to make my first flight very soon.

GPSL is on the schedule provided all works out.

Subject: Re: [GPSL] Correction 14 balloons in the air

Video recordings I've made from near space flights show the sound levels gradually decreasing. At 100,000 feet it's nearly silent. The burst can be heard followed by the howl of air as the capsules descend.

Where are you located? There are probably a balloon group nearby. GPSL will be held in KC this year. Perhaps you could attend that.

Paul

>>> "Pete Lilja" <plilja@...> 11/5/2007 8:08 AM >>>

Sounds great to me! How about this Saturday? Just kidding. It's just that this past Saturday was my first chance to even listen in on a balloon flight and I heard 3 different balloons. I'm sort of excited about this stuff.

I was again watching the incredible video from the flight linked at the bottom of the page here: http://www.depauw.edu/acad/physics/base/pages/BASE18.asp with the volume turned up. I noticed what I'd call a 'rubbing' sound of probably suspensions lines and quick links. Then the balloon bursts with no sound but more mechanical sounds becomes audible during PBC. Is there not enough air to transmit sound at 100,000'? Are any sounds conducted only through solid material at that altitude? I'm curious and surprised.

This something I'd like to see. We could call it Field Day Super Launch.

Paul

With all these balloons in the air at once, perhaps we need to have an ARHAB Field Day with all the groups possible participating from their respective locations.

Dear Pete,

I'm afraid that my editing of the BASE 18 burst segment somehow lost the sound of the burst. I can hear it in the original uncut video. The video segment from BASE 16, where the camera was three times closer to the balloon clearly has the sound of the burst in the online version. (Watch http://www.depauw.edu/acad/physics/base/images/base16BalloonBurst.wmv)

The literature claims that audible sounds are carried through the air to altitudes of about 80 km or 400,000 feet.

Much of the sound is mechanically induced by the tie-wrapped connection of the camera to the styrofoam box.

I'll attempt to re-edit the clip for the BASE 18 burst to accurately convey the audio signal.

WOW THE PICTURES WAS GREAT.

We will be doing that soon also but other experiments first and next on in DEC useing !) gunnplexer and a 32 second repeater for PSK and SSTV.

FEB will be EOS-5 NEw package with more experiments in side and a large chte again.

Bill - YES on the field day balloons in the air many as we can .COUNT ME IN on that Ill be sponcering a Filed Day at my Farm field in JUNE 2008 and we will float a 80m and a 160 m antenna then we'll launch in there too.

IDEA with Yours Bill How about all balloons in America in the Air at the same time???And Many states possible. with the name of each state as a SSID just a ideas in the air. Count on MAINE we'll be up there.

Heck, every EOSS launch is just another field day -- rise at zero-dark-30,
drive a fully loaded vehicle out to the boonies somewhere, set up antennas,
stations, power, logs, etc and prep, fill and launch. Then do some hammin'.
After LOS at ground station, tear down, pack up, drive back and unload.
Maybe grab lunch at local greasy spoon with the teams on the way.

Problem with balloon QSOs is that they're via repeaters, which don't count
towards FD score. Folks working FD are probably gonna concentrate on
making max score and thus wouldn't likely waste time with balloon QSOs.
In fact, EOSS always schedules flight AROUND FD, since it depletes our
operational teams!

10 MHz Amateur Radio balloon to cross the Atlantic

Amateurs at the University of Tennessee Amateur Radio Club are launching a balloon with a beacon in the 10 MHz Amateur Band that may travel across the Atlantic during its 5-day mission.

The latest Icarus X mission UX-19, will hopefully launch by next weekend and its goal is to be the first Amateur Radio equipped helium balloon to cross the Atlantic.

The balloon payload will include a GPS unit and CPU that will regulate the balloon's altitude and send telemetry on 10.123 MHz in CW and RTTY formats.

The 10 MHz transmitter will run 3 watts output into a half wave dipole hung below the balloon.

The students need receiving stations to copy the telemetry data. They have developed a decoding program that anyone can download from the University of Tennessee web site which will relay the values back to the campus server.

All that is needed for the receiving station is a good antenna and a computer with a high speed internet connection. Audio from the receiver is feed into the sound card of the computer and Mtty will decode the values and give a nice visual status page of the flight data. Also the data will be sent to the University of Tennessee's server where it will be placed onto the club's web page for everyone to follow.

The flight has been dubbed 'The Spirit Of Knoxville' after Lindbergh's first trans-Atlantic flight.

The flight could be up to a five days long but the actual crossing should take only three days. The balloon will be carrying enough

ballast and battery power for five days and nights. Check the UT Radio Club's web page at http://www.utarc.org/ for more technical details and a host of photos.

This site chronicles the last years worth of effort at developing the hardware and flight testing the different systems to produce an autonomous altitude control.

In addition to the 30m beacon there will also be an APRS beacon AA4UT-11 on 144.390 MHz FM.

University of Tennessee Amateur Radio Club
http://www.utarc.org/

If you go to their website and click on the Balloon Launch link right above the article you'll go to a page with a neat You Tube video of a previous launch.

Topic: 3836 Message: 3836

Wow! I didn't think my thought would BALLOON into this!! HAH! I KILL ME!!!!!

As for doing a super-launch on Field Day, I'm kinda torn. There's pros and cons about it. I'd like to have everyone do an ARHAB "Field Day", but if it's during ARRL's Field Day, it might be 2nd banana to the normal ops. I'd prefer a weekend we can toot our own horn without another event being in competition for the spotlight.

Pros: It generates interest in ARHAB and may spur some new groups to form, and old groups to come back in.
It gets interest generated from the general public and schools (where applicable)
FD is the one weekend where amateur radio gets the most media (normally local news media) exposure.
It's an opportunity to get a possible record number of balloons in the air.

Cons: Some groups may already be involved with the local FD clubs or groups and will not have time and/or resources.
There's no classification for ARHAB ops (that I'm aware of).
All the media attention will be focused on Field Day itself, and the ARHAB might get a footnote or a paragraph or two. Or nothing.

Perhaps if there's enough interest, we could petition the ARRL to have ARHAB included as its own FD category, or provisioned as a satellite QSO-type entry, but it looks to be eligible for 100 points as a "Non-traditional mode demonstration" already, depending on what's in the payload.
More food for thought.

Hi Greg,

When I've done Field Day balloons in the past, I find it's a great way to demonstrate a flight to the whole club and all the many ham-curious folks who come over to see what's going on....the Huntsville club sets up next to Space Camp and the Space and Rocket Museum, so they get a lot of visitors.

Even though there are no points for the balloon contacts, it sure is worth it to get folks interested.....and yes, we have gotten media attention as a result. Perhaps the League might consider doing a special mode credit for a balloon contact though...particularly if we can organize enough of a group Field Day effort to cover a good part of the US....something to ponder.

3838. UX-18 Post-flight info

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-06 08:46:21 UTC
From: Dan Bowen
Topic: 3838 Message: 3838

Hi All,
Just wanted to recap UX-18 for everybody, though it has been a few weeks. UX-18 was our most successful flight to date in the Icarus series, with all primary mission objectives achieved. The main goals of this flight were to finalize software settings that trigger ballast dump and test the advanced live telemetry web page. The balloon lift was provided by two balloons, a latex Kaymont 350G, and a plastic Zero Pressure made of 2mil U-line 48" tube (that's width when the tube is flat on a roll). This design was used because we needed a quick, economical way to test our ballast system. A full ZP balloon of the U-Line tube we have would have been very inefficient, due to the thick plastic, and we didn't have the sealer experience to put together a whole full size ZP with any confidence. We have flown 4 or 5 zero pressure balloons of our design, and what we've learned is that they are a darn complicated thing to get right, at least at the very small scale.

We designed the zero pressure envelope to precisely lift ONLY the weight of the alcohol ballast we had aboard, and level off at 18,000 ft with it. The latex balloon, which we felt would give a pretty constant lift at most altitudes we'd be at, would provide lift equal to the remaining payload weight. This allowed us to fly a much smaller, lighter ZP envelope, and use less helium. We don't plan to use this for real long duration missions, it was just a quick hack.

We had access to the beautiful modern airplane hangar at our local airport FBO, KDKX, which allowed us to measure lift to the tenth of the ounce on each balloon. The evening was dead calm and clear, some of the best weather for balloons I've ever launched in. The ascent rate was a stately 200-300 fpm, and the balloon just seemed to hang low in the city lights for a long time after we let go. A departing business jet pilot was with us at launch, and mused that he hoped he didn't hit it on departure.

The balloon envelope calculations were off by about a factor of 2, and instead of 18,000 ft, we ended up at 9000 ft, but that was OK, as we had foreseen this possibility and set our ballast trigger altitude to 8000ft. Any time the balloon dropped back down below 8000 ft, it would squirt a l little ballast out every so often.

We wanted to test an HF command uplink system, using a very slow speed, modified ascii (around 1 bps), being detected by a custom designed receiver built by Carl Lyster, WA4ADG and software by Mike Coffey, KJ4Z. This system worked quite nicely, it was able to decode 25% of the 50 commands sent to it until it passed over the HF radio horizon, somewhere in virginia. The commands did nothing, they were

just copied into the telemetry string for our viewing.

The internal temperature was quite nice at such a low altitude, and we conveniently stayed in the middle of nowhere for the entire flight, so there was little risk to air traffic.

The ballast was utilized many times as the balloon oscillated between 7000 and 10000 ft, the ZP balloon didn't seem to equalize very well, and would enter a steep descent after each peak motion. The flight ended about 17 hours in on one of the regular oscillations, the ballast had simply all been dumped. It landed in a rural valley in West Virginia, and we have no active recovery plans for it. Return info was provided on the package. One curious note - this payload and ZP envelope flew the weekend prior, and landed just 50 yards from a major interstate highway (I-40, near Asheville, NC). The folks who discovered the fully inflated latex and ZP balloon quickly called us, and we had the payload in hand by midweek and had retooled the software by the weekend in time for this great 17 hour flight.

Next flight... more ballast, with a better balloon made by Mark Caviezel.

Hi Greg et al,

I agree that there's not much incentive for traditional FD teams to spend any of their 24 hours working zero-point QSOs, since balloons are repeaters. However, so are satellites, and ham satellite QSOs not only count but also generate bonus points! So if we could persuade the League to grant ARHAB the same consideration as AMSAT, well, that's a whole 'nother story. There's also merit in the "non-traditional" scheme, but I think the intent there was to demo "weird bands" like microwaves and light, e.g.

There's still the issue of shanghaiing a minimum launch and recovery team from the traditional FD groups.

EOSS is an ARRL Affiliated Club, and we can't even get a balloon-related article published in QST.

I'm also somewhat active in ham microwaves, and have seen how tough it is to tweak the rules of the "10 GHz and Up" contest to benefit those who work the rarer bands, like 47 and 76 GHz. It took years before that contest even RECOGNIZED 24 GHz!

Mike,

I can believe that. How long ago was that attempt made?

This is an old refrain, but QST does seem to be continuing to very gradually slide towards more of a breezy, mass market gear advertising and simple gear use and review article oriented magazine, particularly in the last 3 or 4 years.

Much, but not all build-it content seems to be funneled to QEX.

Was QEX mentioned (by QST editors) to EOSS as a place where your balloon article might find a home? Or was it a general interest type of balloon article?

Hank

Dear Colleagues,

With our addition of Bill Brown, WB8ELK, as a columnist in the Spring 2007 issue of CQ VHF magazine we have made ballooning a regular feature. Additionally, via my monthly VHF column in CQ magazine I promote ballooning nearly every month.

Regarding EOSS, I am looking for an article about EOSS that would also mention Chris Kohler's training work. Chris' work has been responsible for dozens of new hams over the years that he has done his training.

In short, I would very much like to showcase EOSS and what is happening in that part of the world of ballooning and balloon sats via my column in CQ magazine and in a future issue of CQ VHF magazine.

Hi Paul, et al,

Yes, I want articles on ballooning that I can publish regularly in CQ VHF. The Spring and Summer 2007 issues each contain feature articles that included ballooning. Via Bill's column we will have regular coverage of ballooning events. However, I would like to also cover ongoing programs (such as EOSS) via feature articles as a way of inspiring others to start similar programs in their location.

From my perspective as an editor of a magazine that covers amateur radio activities, I see two emerging stories in amateur radio: education and emergency communications. Ballooning relates to both of these quite nicely.

In other words, please send me your stories and will do everything that I can to give them a venue.

73,

Joe Lynch, N6CL
Editor, CQ VHF magazine

Hi Joe,

And, most of you know that, Paul Verhage writes one or two articles in EVERY issue of Amateur Television Quarterly. So, there are some of the better publications that enjoy ballooning endeavors!

Dear Colleagues,

With our addition of Bill Brown, WB8ELK, as a columnist in the Spring 2007 issue of CQ VHF magazine we have made ballooning a regular feature. Additionally, via my monthly VHF column in CQ magazine I promote ballooning nearly every month.

Regarding EOSS, I am looking for an article about EOSS that would also mention Chris Kohler's training work. Chris' work has been responsible for dozens of new hams over the years that he has done his training.

In short, I would very much like to showcase EOSS and what is happening in that part of the world of ballooning and balloon sats via my column in CQ magazine and in a future issue of CQ VHF magazine.

Hi Hank,

That must have been like 5 years ago or so. And it was written
in a very non-techie style - emphasizing the student involvement
and the thrill of sending student experiments and a ham station
to the edge of space. It certainly wasn't deep enough to qualify
for QEX, even before it merged with Comm Quarterly.

We'd probably get more drivel submitted if we could just get our
Publicity Chair position filled. That opening is now etched at the
top of every EOSS meeting agenda - folks complain about that, and I
tell 'em it'll go away when the position is filled. As it is, the
10% who do 90% are gill-deep in flight-to-flight crank-turning. E.g.,
at our next meeting, we'll be recapping four flights in just the past
month.

It's important to note that you get a 100 point sat bonus for working the first satellite contact, you also get 1 point for your first FM satellite contact (101 points if your first sat contact on field day is a FM sat) and you receive 0 points thereafter for additional FM sat contacts.

Analog transponder contacts count regular points regardless of how many you make.

So unless the balloon is flying a linear transponder, it's only going to be worth one contact and may already qualify under the non-traditional/experimental category.

Mike goood point on the contestors >thats why I set it up with my club that we will do a none contesting site for anyone in Maine that wants to do a noncontesting FD. So we will hold one at my Farm feild with the specail 80 /160 wire antenna in the air and then also the prelaunch and lift off for the EOSRED-FD-2007 launch. But yet I do have a beutiful farm feild with 8.8 acres outlined with 75/90 foot trees oaks and lodge pole pines and 8.5 miles from the Ocean so its going to be a fun one from here.But we might change the name to YANKEE-FD- Launch to go with the club that day.

Bill you drew some good attention on a good idea.

We ready on this end . The word is gone out to the launch team in maine already for us.

3859. Yes its sad that ARRL(QST) does give more expose Articles about HAMMING and balloons

I would like to see someone write about ARHAB for CQ VHF on a regular basis. It would be another way to spread the word about our hobby. I'm currently writing enough that I can't take that on, so could someone else begin writing about their program and how they launch, chase, and recover payloads? It's easier to write these articles when you add photos, too.

So even if we can't get ARRL support, are still willing to schedule a FDSL in 2008? If so, I'd like to start writing about that now.

Paul

Topic: 3859 Message: 3863

As a non-HAMmer,I assume that we're talking about a launch on 28 June 2008. Based on my experience with the recent HALO event, I encourage us to use UTC time. Although early morning launches are more wind favorable, I'm willing to wait for the sun to rise out west and suggest that we consider a launchtime of 1500 or 1600 UTC.

Regardless of the time, BASE (DePauw) will gladly participate, and I anticipate that we will be HAM friendly and individually licensed by that date.

Howard

3867. FDSL ideas

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-08 04:44:43 UTC
From: Greg Williams
Topic: 3867 Message: 3867

I sent this out once via webmail from work but I assume it didn't make it.

contests@... is the contact email for the FD stuff. Perhaps Bill or someone with the credentials and knowledge of ARHAB should send in an email inquiring about stipulations for ARHAB flights.

There are some things to consider about trying to get credits and bonus points for using balloons.

Since ARHAB is a unique mode, should it get its own subset of rules as do satellites? Since the balloon goes up, how would one affect the 300 meter site rule (rule 4.1)

Since the power levels of most payloads is under 5w, how would this affect that scoring?

Based on the rules for satellite and "non-traditional" modes (I have them at the bottom of the email) what I'm considering is first, 100 bonus points for the balloon as a non-traditional mode. Next would be another set of bonus points for the means of communication. And the next would be a QSO points tally depending on the means of communication.

Example #1, if a group sends up a balloon with ATV and APRS, they should get 100 points for using a balloon to lift the payload, 100 points for APRS, and 100 points for ATV.

Example #2, if a payload has cross-band repeat, then perhaps the originating station can get 100 points for the balloon, and since they'd be doing Net Control, 1 point per QSO (unlimited, since I would think it be discouraging to rack up 200 QSOs and only get points up to 100 of them) and stations making contact get 20 points per QSO, up to 100 points.

Example #3, if a payload has ATV or SSTV, then since it is a one-way transmission, have stations receiving the ATV signal show proof that they received the ATV image and get 20 points, up to 100 points total.

Example #4, if the APRS is digipeating, then let stations make no more than 5 QSOs on it for up to 100 points, 20 points per contact. The digipeater would obviously have to be off 144.390. If it's just a position reporting station, perhaps proof of reception for up to 5 of the balloons would be sufficient?

These are rough draft ideas, and I welcome all scrutiny and discussion. I say we come up with a unified proposal and then solicit the ARRL to amend FD to exempt balloon QSOs from the normal rules by whatever guidelines we can draw up as well-balanced as possible.

OR

If we choose to do our own weekend outside of Field Day, what weekend and types of activities, rules, etc?

Below are the rules from 2007 FD regarding satellite and "non-traditional" mode credits:

7.3.7. Satellite QSO: 100 bonus points for successfully completing at least one QSO via an amateur radio satellite during the Field Day period. "General Rules for All ARRL Contests" (Rule 3.7.2.), (the no-repeater QSO stipulation) is waived for satellite QSOs. Groups are allowed one dedicated satellite transmitter station without increasing their entry category. Satellite QSOs also count for regular QSO credit. Show them listed separately on the summary sheet as a separate "band." You do not receive an additional bonus for contacting different satellites, though the additional QSOs may be counted for QSO credit unless prohibited under Rule 7.3.7.1. The QSO must be Earth-Satellite-Earth in nature. Available to Classes A, B, and F.

7.3.7.1 Stations are limited to one (1) completed QSO on any single channel FM satellite.

7.3.10. Non-Traditional Mode Demonstrations: A maximum of 300 bonus points (100 points for each demonstration up to three) for setting up a demonstration of a non-traditional mode of amateur radio communications. This includes modes such as APRS, ATV, and SSTV. Available to Classes A, B, and F.

7.3.10.1. This bonus is not available for demonstration of a mode for which regular QSO credit is available. PSK31 is not eligible as a demonstration bonus as it is now in wide-spread use and is eligible for regular QSO credit.

7.3.10.2. A complete portable packet system may be included as one of the demonstration modes. This system must include a temporary, portable node and must be completely separate from the existing packet infrastructure of your area. Simply setting up a packet station does not qualify as a demonstration mode.

7.3.10.3. Demonstration modes must use the amateur radio spectrum at the point of the demonstration.

7.3.10.4. Frequency bands, such as 10 GHz are bands, not modes of communications and do not qualify for the demonstration mode bonus.

7.3.10.5. Each demonstration mode must be different - that is, you can not claim the bonus three times for doing the same demonstration mode repeatedly.

3868. Re: [GPSL] FDSL ideas

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-08 14:41:12 UTC
From: PAUL VERHAGE
Topic: 3867 Message: 3868

I like the idea of giving the ARRL a suggested point system for balloon contacts during FD. However, a balloon is more difficult for hams in general to hit because it's up for a shorter period of time, isn't in a predictable position days in advance, and doesn't reach as high of an altitude.

Those "features" will make getting a balloon contact different than getting a satellite contact.

I don't have comments on the actual points, since I've not done FD before. So I'll leave that up to people with more experience.

I think either Bill or Ralph might make good people to contact ARRL about this proposal.

If the ARRL isn't interested in adding balloons to FD, then I'd still like to see us do a FDSL. It would give hams something else to contact and show to the public. Again, we could send up a bunch of QSL cards to mail to people making contact with our balloons.

Paul

>>> Greg Williams <k4hsm@...> 11/7/2007 9:44 PM >>>
I sent this out once via webmail from work but I assume it didn't make it.

contests@...g is the contact email for the FD stuff. Perhaps Bill
or someone with the credentials and knowledge of ARHAB should send in an
email inquiring about stipulations for ARHAB flights.

There are some things to consider about trying to get credits and bonus
points for using balloons.

Since ARHAB is a unique mode, should it get its own subset of rules as
do satellites? Since the balloon goes up, how would one affect the 300
meter site rule (rule 4.1)

Since the power levels of most payloads is under 5w, how would this
affect that scoring?

Based on the rules for satellite and "non-traditional" modes (I have
them at the bottom of the email) what I'm considering is first, 100
bonus points for the balloon as a non-traditional mode. Next would be
another set of bonus points for the means of communication. And the
next would be a QSO points tally depending on the means of communication.

Example #1, if a group sends up a balloon with ATV and APRS, they should
get 100 points for using a balloon to lift the payload, 100 points for
APRS, and 100 points for ATV.

Example #2, if a payload has cross-band repeat, then perhaps the
originating station can get 100 points for the balloon, and since they'd

be doing Net Control, 1 point per QSO (unlimited, since I would think it be discouraging to rack up 200 QSOs and only get points up to 100 of them) and stations making contact get 20 points per QSO, up to 100 points.

Example #3, if a payload has ATV or SSTV, then since it is a one-way transmission, have stations receiving the ATV signal show proof that they received the ATV image and get 20 points, up to 100 points total.

Example #4, if the APRS is digipeating, then let stations make no more than 5 QSOs on it for up to 100 points, 20 points per contact. The digipeater would obviously have to be off 144.390. If it's just a position reporting station, perhaps proof of reception for up to 5 of the balloons would be sufficient?

These are rough draft ideas, and I welcome all scrutiny and discussion. I say we come up with a unified proposal and then solicit the ARRL to amend FD to exempt balloon QSOs from the normal rules by whatever guidelines we can draw up as well-balanced as possible.

OR

If we choose to do our own weekend outside of Field Day, what weekend and types of activities, rules, etc?

Below are the rules from 2007 FD regarding satellite and "non-traditional" mode credits:

7.3.7. Satellite QSO: 100 bonus points for successfully completing at least one QSO via an amateur radio satellite during the Field Day period. "General Rules for All ARRL Contests" (Rule 3.7.2.), (the no-repeater QSO stipulation) is waived for satellite QSOs. 3869. Kaysam balloons for sale

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-09 02:48:46 UTC
From: Zack Clobes
Topic: 3869 Message: 3869

I don't foresee Jon or myself flying this coming year, so we've decided to pass on our surplus balloons to someone before they get too old.

We have 3 Kaysam 1000g's that are still sealed, and 3 100g's that have been opened but still look fine. As I recall, one of the 100's was partially inflated as a demonstration at a hamfest. I believe that they were all purchased around 2005, but I wouldn't swear to it.

I've kind of lost track of pricing on these things, but I'm thinking $10 for the three 100's (+$4 S&H). For the 1000's, I'd like $40ea (+$5 S&H). If you want the whole batch, I'd guess $12 would about cover shipping.

If my prices are too high, make me a reasonable offer.

OK for get the rule makeing and decisions for that. FD should be Fun and many many and awhole Bunch of Hams like to do field day but get turn off because of rules and contesting.

Thats why we are wit our club in Maine the the YANKEE club is going to have a none contesting site. For the Real HAMs who are left out. to feel the real fun of radio and experimenting..

We will have a NON CONTESTING SITE
#1 GOAL: HAVE FUN
#2 SHOW many as we can of new and Old HAMS there is still fun FD with out all the rules.
#3 Set up any thing and transmitt and contacts and have fun
#4 TETHER several Balloons from the loaction with different things to try out for anyone and enjoy it.
-----40 m inverted VEE at 100 ft and then 200 ft compareing the contacts
-----75/80 m Antenna same idea
-------160 m 1/2 antenna or what ever depends on the wind that day and HAVE fun and compare usefulness of antennas at 100 foot and 200 feet and back to 50 ft.
--- cross band repeater try out.
-----ATV
------SSTV Repeater at different leights at 2m/6m
------ how to prep a balloon for launch safety wise and ideas to put on it from any one that shows up.
-----17/20 meter 1 full wave long wire
--- and small VHF and UHF ANteenas and beams and what ever in the Air haveinf fun and answering questions and facts on why how and how about's??
#5 BBQ and BS time and camp out and table talk.
#6 show and tell different equipment and brag time
#7 HAVE FUN
#8 Bring your instrument for the ones who plays something and JAM /JAM
#9 table with literture.
#10 tables with trades
#11 FOOD and more food and potlucks
#12 Family time and have fun
#13 Make it a real fun FD
#14 BALLOON LAUNCH

HHHMMM is there more???? OOOHH YES everything and anything for all HAMS who wants to belong to FD rememberance time..

RULEs only the FCC RULES and HAVE fun with PLAYING radio.. Thats a real FD

I CANT WAIT ....FDSL2008 from MAINE we going to have the best fun day yet..

3872. Alternative APRS frequencies and ATV calling frequency

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-10 20:33:39 UTC
From: wb8elk@aol.com
Topic: 3872 Message: 3872

This is a note from Bob KA9UVY - very active ATV station in Illinois who also follows balloon flights with interest.

I agree with him about the secondary frequency.....only use 144.34 MHz for a balloon that also is carrying ATV onboard.....otherwise, try 144.36 or some other alternative since 144.34 is the national ATV calling frequency. I have used 144.34 MHz APRS on balloons carrying ATV in the past just for the reason to alert ATV folks that a balloon is in the air. However, if no ATV, then it can tromp on the calling frequency, particularly since alternative APRS channel activity is usually a much higher repetition rate data than on the 144.39 frequency.

The most active ATV area for conflict would be the Midwestern States. For those with balloon footprints that don't cover the Midwest, check to see if there is much ATV activity in your area (out to 400 miles from you) before flying on 144.34....I know some might still be using PocketTrackers which are fixed with either 144.39 or 144.34 only....but the newer APRS units are synthesized so this should help with the problem.

A good source of ATV activity and reports....you will find ATV balloon reports here as well: _http://www.dxworld.com/atvlog.html_ (http://www.dxworld.com/atvlog.html)

A number of ATV hams also have a Camstreams link going that allows you to watch what an ATV station via the Internet.....here's KA9UVY's camstreams link:....he left it running so anyone could see the ATV balloon via his ATV receiver in Illinois:

http://ka9uvy.camstreams.com/ (http://ka9uvy.camstreams.com/)

- Bill WB8ELK

Here's what Bob KA9UVY wrote:
==========

James, I read your comments about using wide1-1 on balloon payloads and it did seem to make sense.
Being an occasional user of APRS I admit that I have never fully understood the different paths etc.involved with the network and I am sure that many of us do not.
I do however have an issue with the use of 144.340 as an alternate APRS frequency. It seems that many are not aware of the fact that 144.340 is the National ATV calling and talkback channel.
Being a serious ATV enthusiast prompts me to write this note to make you aware of that fact. It is somewhat frustrating when you are trying to communicate with phone while the constant packets come blasting in from 100's of miles away.

If the payload has ATV on board I don't have a problem with it. In fact
it alerts many less informed operators to start looking for video from the
skies but if your not flying ATV please find an alternate frequency other than
144.340.
144.340 has been used for decades as the primary ATV talkback channel and
if possible we would like to keep it clear for ATV use.

Just my 2 cents

Thanks Bob and Bill for your comments. I was aware that 144.34 MHz
was used for ATV calling freq, but not how much it actually was being
used (or how much balloon traffic was interfering).

With the proliferation of balloon groups around the US, it's probably
time we found our own APRS alternate freq other than 144.34 MHz. We
have used 144.36 MHz with no known issues. Is 144.42 MHz otherwise
occupied? That would be a nice third freq for events like GPSL
(144.39 MHz +/- 30 kHz.

We should start promoting this soon, so other equipment manufacturers
don't end up locking us into the 144.34/144.39 paradigm.

I will look at moving NSTAR off 144.34 after tomorrow's flight.
Should not be a major issue since all our payload radios are
synthesized.

Hi Julius,

If you haven't perused the FAA's regs on unmanned balloons, etc, in
FAR-101, I urge you to do so to get a better understanding of how to
use the civil airspace. There's an annotated copy on unmanned balloons
downloadable from the "library" page on www.eoss.org, as well as a link
to the full FAA document. A current FAA sectional chart from your
nearest general aviation pilot shop is a very useful tool to learn
about airspace usage in your area.

3875. Re: [Balloon_Sked] Re: Alternative APRS frequencies and ATV calling frequency

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-12 09:13:42 UTC
From: wb8elk@aol.com
Topic: 3875 Message: 3875

Hi Mike,

I've used 144.34 as a balloon frequency for APRS, simplex and crossband repeater as well as voice tracking beacons for some time specifically to alert the ATV crowd that an ATV balloon was in the air since the majority of my balloons in the past have carried ATV aloft....I would still suggest 144.34 APRS in the case where ATV is used on a balloon, but only at a once or twice a minute rate to allow the ATV ground stations to communicate with each other during the flight. The ATV groups have been very supportive of ATV balloon flights and I'm even going to do a simplex ATV repeater balloon in the near future.

The reason you haven't received a complaint in the Denver area, is that ATV activity there is limited mostly to ATV repeater groups who often use a local voice repeater for comms and your footprints don't quite reach the eastern KS or OK ATV activity areas. The highest 144.34 activity is for the ATV folks who enjoy long distance tropo enhancement contacts and there is a very active contingent who work each other on fastscan ATV in the 70cm band (439.25, 434.00, 426.25). Some of these contacts can stretch out to 600 miles or so.

Although there have been no complaints I'm aware of in the western Plains states or the west coast, there have however, been a number of complaints in the Midwest....Illinois, Indiana, Missouri and Michigan to be specific. The Midwestern and eastern Plains states hold the hotbed of ATV DX activity....the most active states are: IL, IN, MO, WI, MN, IA, OH, MI, PA, NY, OK, KY and KS...there are a few avid ATV DX folks in other states, including TN and AL (myself). Since I operate in both the ARHAB and ATV worlds, I'm just suggesting that folks be aware that there have been complaints and consider 144.36 or another freq as an alternative and I also want to head off future manufacture of fixed freq alternative on 144.34 such as was the case with the PocketTracker. If you're crystal controlled, then be aware that if your footprint covers the above states, you may generate some complaints. If I hear of any complaints of interference to the ATV calling freq in those cases, I'll forward them here.

I think the real problem is caused not by infrequent once or twice a minute transmissions....but since it's an open channel with no other APRS activity the trend has been to send APRS data out every few seconds by balloons on 144.34.....so my suggestion is that if you are flying in the Midwest with a crystal controlled or PocketTracker fixed freq APRS on 144.34, consider sending out packets no more than once or twice per minute to give the ATV guys a chance to use the frequency.

With the proliferation of newer balloon and college groups, my goal here is to set the example for an alternative APRS balloon frequency to something other than 144.34....(144.36 comes to mind as the most logical choice).

- Bill WB8ELK

Hi Bill,

As I noted earlier, this is the first gripe about use of 144.34 I've heard in 16 years. And I'm gonna urge the group to move from 144.34 to 144.36, with fingers crossed that we don't hit some other groups "private allocation". Picking beacon freqs is a real risky game, since one rarely can determine what sort of QRM the command receiver will encounter or whose ox one might gore from 20 miles up. So any QSY is undertaken with eyes open re those risks.

If 144.36 turns out to be QRM-ville on CO, I'll assure you that we'll be back on .34 PDQ.

Topic: 3875 Message: 3877

Hi Mike,

I think a good compromise could be that rather than abandoning 144.34 for balloon use altogether, that when flying in a very active ATV region (the Midwest states mentioned in my last email), that the update rate be no more than twice per minute in order to allow ATV voice comms. In other regions of the country, I wouldn't be too concerned unless complaints are received. I'm pret ty tied into the ATV and SSTV community, so I can forward any complaints that I hear about. The majority of the ATV community is very balloon friendly and supportive....ATV Quarterly magazine even prints regular ARHAB stories in almost every issue (whether the balloon carried ATV or not). After all, it was the desire to increase my ATV range that prodded me to put up my first balloon 20 years ago.

I don't foresee any problem at the moment for EOSS or the western states even with higher rate APRS updates due to the sparse ATV activity in those regions. In the more populous areas of CA and AZ, they tend to use other 2m freqs for ATV voice comms. Rather, I'm suggesting we look for one more alternative APRS frequency that can supplement 144.34 and be a frequency where we can do rapid APRS updates with little or no interference to other hams regardless of the region....a frequency that can be recommended for newer groups and colleges that are coming onto the ballooning scene who might not be cognizant of ATV use on 144.34. I mention this since one college in MI sent out packets once per second on 144.34 in some past flights and this definitely generated some complaints and wiped out the channel for the flight duration...I seem to recall that they changed to 144.36 after that with no complaints. For those of you who also put Gateway stations on 144.34 for balloon flights, I would recommend that they be receive only.

The main thing that concerns me about 144.34 use for APRS is the possibility that the APRS community will start to consider that as an alternative channel for APRS and start putting digipeaters up there...which has actually happened in a few places....I would think this trend was driven by commercial APRS manufacturers such as the PocketTracker alternative 144.34 channel. This would not be a good thing for either ATV or Ballooning I would think and is really the thing that worries me the most. It's my hope that the newer APRS trackers with built-in RF modules will be synthesized (as they seem to be doing) to head off the possibility of commercial units driving 144.34 as the APRS alternative for the entire general ham population. I must say it's particularly annoying to try to make ATV DX contacts or to track a distant ARHAB balloon and have to listen to local APRS mobile and home stations popping up day and night on 144.34, which I have heard much more frequently here than I'd like from my mountaintop QTH.

We've used 144.36 in past GPSL events with no apparent complaints so that would seem to be a possible choice. I don't know just how much SSTV activity occurs on 144.36...I'll ask some of my SSTV friends about that. Both 144.36 and 144.42 are the most logical choices since they are evenly spaced from and close enough to 144.39 to make for an easy frequency shift when tuning between the APRS network and a clear channel.

In this case, hydrogen or helium-filled manned balloons (as opposed to hot-air or hybrid Rozier types).

Date: 2007-11-16 21:29:11 UTC
From: Mike Manes
Topic: 3887 Message: 3887

Hi Adam,

Mr. Hendickson's interpretation may be obsolete. The 2007 version of
14 CFR Part 97 defines a repater as:

(39) Repeater. An amateur station that simultaneously retransmits the
transmission of another amateur station on a different channel or channels.

Note that this definition excludes simplex repeaters.

Here's the rub, though:

(f) No amateur station, except an auxiliary, repeater or space station, may
automatically retransmit the radio signals of other amateur stations.

So yeah, if a simplex "repeater" isn't a repeater by FCC definition, then
it must be an auxiliary station operating above 220 MHz.

But a 2m/70cm crossband repeater does conform to this rule:

(b) A repeater may receive and retransmit only on the 10 m and shorter
wavelength frequency bands except the 28.0-29.5 MHz, 50.0-51.0 MHz,
144.0-144.5 MHz, 145.5-146.0 MHz, 222.00-222.15 MHz, 431.0-433.0 MHz and
435.0-438.0 MHz segments.

Let's take a look at the "auxiliary station" question for simplex repeaters,
defined as:

(7) Auxiliary station. An amateur station, other than in a message forwarding
system, that is transmitting communications point-to-point within a system of
cooperating amateur stations.

So far, so good. How about 2m operation?

(b) An auxiliary station may transmit only on the 2 m and shorter wavelength
bands, except the 144.0-144.5 MHz, 145.8-146.0 MHz, 219-220 MHz, 222.00-222.15
MHz, 431-433 MHz, and 435-438 MHz segments.

Yes, so long as it abides those forbidden sub-bands.

I guess my point is that when all else fails, read the book - in this case,
Part 97 - rather than searching the web for a blog. Now, Part 97 doesn't
read like an Icom user manual, so if you're still scratching your head,
ask the ARRL. I just did, and clipped this from a .pdf of QST's "Washington
Mailbox". It seems that Mr. Hendrickson may have updated his view:

Q: Are the rules for simplex repeaters the same as duplex repeaters?
A: A “simplex repeater” is not a repeater according to the FCC. It does not
simultaneously retransmit the signals of another station and it might not

retransmit the signals on a different channel or channels, as specified in the FCC’s definition of a repeater.

Since it isn’t a repeater, such a device cannot be operated under automatic control. If a control operator is present and controlling the device, either by local or remote control, then it can be used, but it cannot be left unattended! On the other hand, it is not limited by the other repeater rules, such as specific repeater frequency limitations. Auxiliary stations must control the simplex repeater and control must be conducted on frequencies authorized for auxiliary operation (above 222.15 MHz, except 431 to 433 and 435 to 438 MHz).

Special thanks to Gary Hendrickson, W3DTN, chairman of the Mid-Atlantic Repeater Council’s Open Band Planning Committee, for his assistance with this column. As the TMARC coordinator for 25 years, Gary is a recognized expert in the field of repeater coordination and complex repeater operations.

So yeah, as with ANY ham station, there MUST be some means to allow the control operator to QRT the station in the event of interference. This is kind of a buggaboo for balloon-borne transmitters, since few can be shut down using auxiliary links above 220 MHz. My view is that the typical balloon flight last less time than it might take to identify, contact and deploy a control operator to take that action. And since balloon APRS beacons also serve a public safety function if the FAA is relying on them to clear airspace, then there are some ameliorating conditions.

3890. Re: [Balloon_Sked] Cross-band repeater frequencies

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-17 01:56:26 UTC
From: Mike Manes
Topic: 3887 Message: 3890

Hi Adam,

In-band repeaters SHOULD be coordinated per your ARRL section Freq Coordinator, although it's not an FCC requirement. However, if your odd-ball in-band choice causes problems with other users, then the FCC might step in.

Now, there is no freq coord established for cross-band repeaters, so use of simplex freqs, within the aux freq limits noted earlier, should be OK. It would be real POOR form to use one of the freqs in use within 400 miles of your flight trajectory, however.

It may be a good idea to verify your choices are clear. It's been suggested that one could do a balloon survey of a candidate freq simply by flying a receiver and digital voice recorder.

One glitch that we ran into on ORB-7's EBBE flight was an unlisted UHF remote receiver (in the simplex part of the UHF band) for a 2m repeater. We had the 2m repeater keyed every time the x-band operated. I found out about it after the flight and contacted the repeater owner. There were no hard feelings. We listened to the UHF freq. for weeks to make sure there was little or no activity on it.

Boy, what a bummer. But I guess it beats going thataway in a hospital bed with tubes jammed in every orifice you can think of, and then some,

Here's a clip from the piece on the web site:

KCCI has learned that Dr. Tom Boylan, 62, and Bradley Brookhart, 37 from Littleton, Colo., died in the crash. Boylan is from Fort Collins, Colo., and had more than 20-years experience piloting balloons.

Rescue crews said Doug Chaplin, of Albuquerque, was flown by helicopter to Mercy Medical Center North Iowa in Mason City. Chaplin had serious injuries. His condition is unknown.

Police were able to talk to Chaplin who told them the crew was attempting to land when they hit the power line, but he wasn't able to explain why the crew was landing. Friday, he was listed in fair condition.

"For some reason (they) were coming down. We got witnesses that watched and as you can see there, they caught the top wire. And at that point the balloon and the basket separated, and it's about a 65 foot drop," Sheriff Larry Richtsmeier said.

The balloon top blew more than a mile north of the crash site.

HeeHeeHee... I love it! So did the kids!

The last capsule was filled with marshmallows!

That launch technique worked really well.
In that wind we played on the safe side
and decided not to have the kids hold the
payloads.

Really needed "MORE GAS"!
HOLY HELIUM! Ended up with 500 fpm.

:)

One of my students brought to my attention, a web page about removing the diode laser from a DVD burner. We I tried it out and have a laser that will now cut black tape and pop black balloons. I'll try lighting a match with it later.

You can see my mini webpage on it and the video at nearsys.org. Click under Other NearSys Projects. By next week I'll add stuff about my single lens microscope.

Hi Harry,

We ran a marshmallow on EOSS-100 for Steve K0SCC's son. Came back
looking like my grandpa!

I expect that your standard tethered launch technique woulda made for
an equally entertaining video :=}.

BTW, one major briefing item for payload handlers is to cradle the
payload in up-facing hands and not to grip it. The other is to
get the fastest runner on tail-end charlie (usually an APRS beacon,
since they're designed to fly like plumb bobs).

It's tough to get an accurate fill with that much false lift. Merle
combines both the tare weight and tank pressure measurements to
estimate a good fill even in windy conditions. And if all else
fails, we apply the EOSS motto: "A little more gas". Overfilling
for a windy launch does get the flight string clear of nearby
obstructions - and may not adversely affect burst altitude, as
we've seen so many times. I figger, what the heck, we paid for that
full bottle, so let's use the last CF :=}.

Mike,

I talked to Billy (N5QEM) from NTI yesterday.
As it turns out I had the fill right on the money.
Instead of the tare jug being 8 lbs, he only had
6 lbs. That only gave a total free lift of 1 lb
instead of 3 lbs for 1000 fpm. So 500-600 fpm was
right on.

They are also going to do some testing to find out
if they can figure out why the Position reports were
lacking altitude for a great deat of the flight.

Hi Harry,

OK re the light tare weight. Might consider tossing a fish scale in
with your fill rig to check things out before launch. Still, it's tough
to SWAG a good fill with that much wind. It did seem from the video
that the wind was quite variable, however, so you could get a fair to
middlin' neck lift during the calm moments.

If you'd been beaconing raw 'GGA records, you could have seen the number
of birds in view. You need at least 4 to get a 3D fix. This would
help determine if the GPS was getting puny due to temperature or some
other influence. You'd lose the course and speed info, but that's easy
to discern from the track on your APRS map display.

3900. Changing an unattended FM radio's frequency

Yahoo group: GPSL (2002 — 2008)
Date: 2007-11-29 02:52:35 UTC
From: Hank
Topic: 3900 Message: 3900

Has anyone ever had occasion to change the frequency of
an over the counter VHF (or UHF) radio automatically?

This isn't actually a question limited to a balloon
environment.

To explain the question a little more, here's an example:

An unattended APRS transmitter that would preiodically
transmit on the standard APRS frequency, plus another
alternate frequency.

Hank

I haven't but there is some stuff coming out soon which will allow
this. Take a look here:

http://www.rpc-electronics.com/rf.php

I believe there is also something coming in the MicroTrak line which
can do this too, configurable from a variant of the TinyTrak
interface.

We, ANSR - The Arizona balloon guys, use Maxon embedded radios. They have 4 control lines that you pull low to select 1 of 16 channels. They are full 5 watt radios in a rugged package. We use them to select the frequency for cross band repeater or APRS. But you could transmit on 144.39 and alternate if you wanted.

I think it's possible to swap the Alinco DJ-Cx HTs between CALL and MEM or CALL and VFO by toggling a closure on the CALL button contacts. This is a typical scanned switch matrix, so some care must be taken to avoid loading the scan lines, e.g., using a reed relay. I've not done it, since the need's not arisen. One potential problem with this scheme is that there's no easy way to verify which of the two alt freqs is active at a particular time; perhaps by isolated detection of drive to the "V" or "M" LCD segment?

I think the Maxtor radios used by ANSR are freq-agile via the serial I/O port driven by their on-board Rabbit 'puter,

The TH-D7 does a beautifully simple job of this via ASCII serial
commands, check out our notes on it at:
http://www.utarc.org/wiki/index.php/Using_the_Kenwood_TH-D7
We bought one for that purpose, but were too cheap to send the
expensive D7 into the air, our local terrain doesn't allow good
recovery chances.
Thanks,
Dan

Thanks for the great responses to this question.

I could have been a little more expressive about the
over the counter concept. What I'm looking for is
any *hacks* of mass produced radios, not uses of niche
radios that are intended for, or close to being intended
for (the Bee), multiple frequency operation .

So the Alinco situation outlined by Mike is exactly what
I'm curious about.

The other specialty products are also very nice to know about,
and it might be just as good that the wording was initially
a little ambiguous.

well, you could always just reverse engineer the microphone serial protocol on those rigs that are controlled by a keypad in the hand mic :-)

I've controlled and changed frequencies an FT-8500 Yaesu through the data jack on the back of the radio. I've also controlled and changed frequencies on the older FT-5100 Yaesu radio. In both cases I've used the Basic Stamp to send the commands to the radios.

The code for the 5100 is still out there on my website at http://www.ke4fgw.net/ft5100.bs2

The Basic Stamp for the FT-8500 acted as a go-between or interface controller between my NHRC repeater controller using the CI-V line of the controller and the radio. It's code can be found at http://www.ke4fgw.net/ci-v.bs2

From: K. Mark Caviezel
Topic: 3910 Message: 3910

pm (PST) Has anyone ever had
occasion to change the frequency of
an over the counter VHF (or UHF) radio automatically?

This isn't actually a question limited to a balloon
environment.

To explain the question a little more, here's an
example:

An unattended APRS transmitter that would preiodically
transmit on the standard APRS frequency, plus another
alternate frequency.

Hank
>>>>>>>>>>>>>>> yes, activating the 'call frequency'
feature of many alinco's will work. And Mike
correctly points out that the most simple
implementation of this can make it hard to know which
frequency you're on.

3913. DTRC radio listeners frequency is 10.1225

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-01 19:44:20 UTC
From: Dan Bowen
Topic: 3913 Message: 3913

UX-19 "Spirit of Knoxville I" radio listeners: John W2KI in Harriman, NY reports reception of HF signal on 10.1225 usb plus 1500hz audio. Schedule is as follows:

VHF APRS: position and every 21 seconds, telemetry every 63 seconds
HF RTTY Daytime: position and telemetry on the following minutes past the hour: 0 10 20 30 40 50
HF CW Daytime: position on the following minutes past the hour: 5 15 35 45
HF RTTY Nighttime(between 2300 through 0500 in balloon's local time zone): position and telemetry on the following minutes past the hour: 0 30
HF CW Nighttime (between 2300 through 0500 in balloon's local time zone): position on the following minutes past the hour: 15 45
Thanks,
Dan Bowen

Hi,

I've been monitoring 10.2200 and 10.2205 MHz on CW with a narrow filter
for several hours from my QTH in Denver CO area with no joy - just a few
RST 119 peeps from time to time, but not per the scheduled xmit times.

Suspect double-hop props on 30m aren't making it out this far.

What is the RTTY baud rate and FSK shift? 45 & 180 Hz?

I see that as of a few minutes ago, 95 minutes of ballast have been
dropped. How many "minutes" of the launched 6 lb remain to manage the
overnight chill?

Hi Bill,

OK, then that would put the carrier on 10,123.2 - 2.300 KHz = 10.120.9 KHz.
Perhaps I've not been listening on the right freq.

Now even with our record of 45 & 0 this one NSS would NOT be able to
get back. At least not anytime soon,, Hey

a technicality question here. for the crossing of the stlantic
competition,, does it need to stay airborne all the way..

It looks like it'l land in the Gulf Stream,, and it still will make
it all the way across,,

Dear friends,

Has anyone flown the Byonics MicroTrak 300 with the
1/4 wave whip antenna?

I'm planning on flying the system with a Garmin 18 and
can easily fly with either the whip or a J-pole.

All feedback is appreciated.

I have flown two of them with the standard wire whips and they both worked fine. In fact, my 32 hour flight that launched from Bill Brown's "20th Anniversary of ARHAB" celebration used this same configuration.

I haven't, but I'd suggest using if possible a second 1/4 wave whip to comprise a full 1/2 wave dipole. This is what I've done on our payloads.

The 1/4 wave in space doesn't form a complete antenna, although it certainly will radiate.

Hank

Hi Howard,

Since a whip requires a counterpoise and will pump full feed current thru whatever "ground" it sees, I think you could avoid a mess of EMC problems by using a J-Pole. The Byonics products I've worked with (TT1 - TT3) are particularly susceptible to upsets from common-mode and near-field radiated RF.

Thanks, Walter

EOSS will be flying the 6th Big Blue glider experiment again next April. We'll be launching from our Windsor CO site. One of those videos was shot at the Deer Trail CO site, which we had to switch to at the last minute due to a trajectory from Windsor which would have required a gate reservation at Denver Int'l Airport :={. The rest have gone out of Windsor, where Gene Fatton generously hosts the Big Blue students and faculty during the week prior to launch as well as allowing us to set up our ground station in his sun room.

BTW, I was the dood with the blue ball cap and bad haircut peering thru the telescope. I had hoped to view the descent just 10 mi S of the launch site, but no joy.

The KG5YLM callsign on the fuselage belongs to Bill Smith, Dr. Smith's OM.

Howard,

I've flown two missions with the MicroTrak300 with it's standard 1/4 wave wire whip....I was going to add a 1/4 wave ground wire for a better match, but forgot to do so on both missions and they worked just fine with very complete coverage via the APRS network on both flights.

3929. Hunter discovers fallen Canadian science balloon (Maine)

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-09 02:25:31 UTC
From: Greg Williams
Topic: 3929 Message: 3929

HIGHLAND PLANTATION -- When Stanley Giguere went out deer hunting Nov. 24, he was startled by what he said looked like a big orange parachute in a tree near Spruce Pond Road.

"I went and investigated it. It was a great big balloon that had popped. It was about 30 feet across and down at the bottom was a pink box with an antenna sticking out. I saw a red light on. It had a camera in it. I had mother with me and I said: 'It's looking at us.'"

Giguere chucked the balloon into the back of his truck. He and his wife, Retta, took it to their home three miles away in Pleasant Ridge Plantation, where they began to examine it.

"I took it apart and all there was, was little stickers of this school. We looked it up on the computer and e-mailed them: 'We found your balloon,'" said Giguere, the road commissioner of Pleasant Ridge.

What Giguere had happened upon was a weather balloon project undertaken by parents and children of the Perth Children's House Montessori School in Ontario, at least 550 kilometers away as the crow flies.

What Giguere didn't know was that a tracking car with three residents of Perth was circling the area at about the same time, in search of the downed balloon. By 10:30 p.m. and Peter McCracken and two friends were driving around Stratton in the dark.

"I tried to call him the next day," Giguere said. "But before I got off the phone, this guy from Fairfield pulled into the driveway tracking it. These other guys (from Perth) weren't but 10 minutes behind. It was pretty amazing. They tracked it right to my doorstep."

The Fairfield man was Eric Foster, a ham radio operator who had been tracking the device, according to McCracken, who had taken a long and speedy trip from Ontario to the hills of Highland Plantation in search of the balloon, using laptops to track it by radio signal.

"It was a very long day for us," McCracken said Monday by phone.

McCracken said the balloon project was an extracurricular science activity for the school. They purchased the balloon at a specialty store and did class science lessons about weather balloons. They enlisted the help of the Amateur Radio Emergency Service and launched the balloon at 9:45 a.m. on Nov. 24, complete with a Global Satellite Positioning system receiver, camera and radio transmitter. Inflated on the ground, the balloon was about six feet in diameter and filled with helium. As it increased in altitude, the balloon expanded to nearly 30 feet in diameter, when it was expected to break.

"Stanley (Giguere) found it the same day. It doesn't take long when it's going 160 miles an hour in the jet stream. We didn't get there until about 8 p.m. that night, at which point it was very dark," McCracken said. "We got to within a half-mile of where the balloon was, but couldn't go after it because it was too dark, and we were on the wrong side of a big river. We knew where it landed, but once he picked it up and threw it in his truck, we couldn't see (the radio signal) anymore."

Turns out the Perth folks were on the wrong side of Burnt Hill Mountain, which Giguere said "borders real close to Long Falls Dam Road in Lexington. You could look right down on the Highland Lodge, but you can't drive there from this side. In a straight line, it's about 3.5 miles from my house, which is at the top of Pleasant Ridge Plantation. They were expecting it to go to Lake Champlain and it came right across the mountains into Maine."

McCracken said four cars loaded with helpers and laptops got as far as the border at Woburn in Quebec at about 5 p.m. that day, and decided only one car would cross.

"We were burning the candle at both ends," said McCracken, who was joined by Rick Szijarto and Marc Baillon. "The border guard wondered why we had a canoe on the car in the middle of the winter. But if it landed in water... we didn't have any control over that."

McCracken said the balloon reached an estimated altitude of 118,000 feet. He said they had accurate measurements to 78,800 feet, but because of military restrictions, the GPS system is required to limit the measurements in terms of velocity, acceleration and altitude: "That's basically so someone can't make a cruise missile and bomb the United States. We estimated it went about 550 kilometers as the crow files, or as the balloon flies I should say. That's about 350 miles to Highland Plantation.

"We still didn't have contact," McCracken said, "but when (Giguere) opened up the package, it gave one final gasp of information to the airwaves and we found him that way, on Sunday around lunchtime, 11 a.m. Nov. 25." He said David Corigan, a hunting guide from Pleasant Ridge, was a big help.

McCracken said ham radio operators and Internet followers were tuned in from all over the country: "We got calls from Tampa, Florida, the Midwest and Quebec."

For Giguere said it was an equally amazing adventure: "Technology nowadays is really unreal."

3930. Totex vs Pawan (India) balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-11 06:56:16 UTC
From: Mike Manes
Topic: 3930 Message: 3930
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Folks,

While googling for balloon storage temperature info, found this comparison
between Totex natural latex and Pawan (India) neoprene balloon burst altitude.
Note that the altitude is expressed as barometric pressure in mbar.
100 mbar ~ 50K', 10 mbar ~ 100K'.

Ya pays yer money, ya takes yer choice :=}. Totex earns its keep, IMHO.

Subject: [ORB] TV camera in payload

Hello;

I would like to inquire if anyone has even put a small color TV camera and transmitter in a balloon
payload (440 or other?).

If so - what type of camera, source and cost data would be most helpful. I'm looking for ideas for
TV payload destined for 100K altitude.

cheers

Subject: [SGSatellites] Balloon Flight Program for Minority Institutions

Please find attached here a Call for Participants in the "Physics & Aerospace Catalyst Experiences in Research (PACER)" program. PACER, funded by NSF and managed by Louisiana State University, is designed to help minority institutions implement their own student ballooning program. A nine week workshop during the summer of 2008 will train teams from two institutions in the details of designing, constructing, managing and flying a small latex sounding balloon student payload. (Each team consists of a faculty member plus three students.) We then follow and assist the institution during the next three academic years while they implement a program for their own students. Details about the level of support provided, requirements and application materials are provided in the CFP.

A Notice of Intent is due on January 25, 2008 and the complete application is due March 7, 2008.

Please forward this e-mail to those you feel might be most interested in applying and feel free to contact me (guzik@...) with any questions.

3933. [AD] One / Four Watt BigRedBee GPS

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-11 19:42:05 UTC
From: k7rkt
Topic: 3933 Message: 3933

Here's a update on the BigRedBee family of transmitters that you may find interesting.

A 1 and 4 watt version of the BeeLine GPS Telemtry Transmitter is now available. This device packs a 12 channel GPS (tested to > 60K' MSL), 1200 baud AX.25 data modem, frequency agile 70cm FM transmitter, and a 4 watt amplifier on a single board measuring 3 3/4" x 1 1/4" and weighing less than 2 ounces. The 1200 baud modem transmits standard APRS data packets containing latitude, longitude, altitude as well as course and speed.

Preliminary pricing of the amplified version will be about $40 more than the non-amplified version.

I'll be adding more information to my site soon, but a picture can be found here.
http://bigredbee.com/tmp/amp2.jpg

Details of the non-amplified version can be found on www.bigredbee.com

I'd be happy to answer any questions you may have.

Regards,

Hi Dan,

EOSS has been flying 70cm DSB-AM ATV off and on since 1990. We use a
PC Electronics KPA-5 transmitter and a W6AOL little wheel horizontal gain
omni antenna. We've used a variety of cheap single-board color and B/W
cameras - anything that puts out standard NTSC baseband video will work.
We ID using MCW tones from a Basic Stamp on the audio channel.

3935. Transmission Frequency Rate and Battery Life

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-15 02:05:57 UTC
From: Pete Lilja
Topic: 3935 Message: 3935

For you experienced HABists:

I understand there will be variability in what different groups of fliers do but I'm trying to wrap my head around the following:

At what time frequency do you set your APRS transmitters to signal their position during balloon flights?

Minimally how long do you want your transmitter batteries to last on flights?

Thanks,

Pete

3936. Re: [GPSL] Transmission Frequency Rate and Battery Life

Hi Pete,

EOSS beacons GGA every 30 sec and RMC & TLM every 60 sec on our single and two-fer flights out of Colorado. For GPSL, we back off to 60 sec to share the time-slotted freq. Our primary APRS beacons also carry full TNCs so they can digi the chase team beacons as well that of the other balloon on two-fers.

As a rule, we design for a minimum of 24 hrs beacon power, although that's overkill. We power up 30 - 45 minutes prior to launch, and the chase team typically has nailed the landing site within 15 minutes of touchdown. So 4 hours is about all we actually use, typically. We are less generous with experiments and non-mission-critical payloads, however. Of course, batteries that fit are available in pretty coarse increments of mAH capacity, so quite often we end up launching well over 24 hrs beacon life.

Note that we ALWAYS fly redundant beacons on every flight in order to keep Murphy at bay: one APRS plus one DF or DF/APRS. This has contributed materially to our 125/125 recovery record.

I'm still testing, but the battery life of the 1 Watt BeeLine GPS
looks to be about 24 hours with a 1000 mah 3.7V li-poly battery
transmitting once every 30 seconds. Things will scale fairly linearly
by adding larger batteries, or changing the transmission frequency.

OK, it's winter and I'm not flying but still planning of my first HAB flight. In reading several HAB web site often references are made to the temperature both inside and outside the payload box. What type of thermometer is used to do this? Is it incorporated in to the APRS packet? Stored and retrieved after the flight?

Thanks,

Pete

Hi Pete,

EOSS's KPC-3-based APRS modules use the analog telemetry frames to downlink interior and outside air temps using the LM335 sensors. Telemetry gets parsed and logged in real time by Nick Hank's (N0LP) ground station software.

The LM335 does suffer from some self-heating errors, especially in the thin air up there. This is evident in the much lower temperatures logged during descent, when airflow is much faster, compared to ascent at the same altitudes.

We've used the sudden drop in air temp as a secondary indication of burst, back when GPS was less than 100% reliable.

The self-heating problem could be cured by gating the bias current on only during measurement samples, but that's not easy with the KPC-3. It could be done using an asynchronous external analog sample/hold circuit that runs at least as often as the telemetry downlink. Or using any of the newer pea-power temp transducers.

The group at UND uses National Semiconductor LM335Z sensors, connected to a logger (usually a Basic stamp II through an analog to digital converter).

Topic: 3941 Message: 3945

NSTAR uses a combination of two things:

1) LM335's run through an A/D converter, which is formatted to APRS telemetry format and transmitted once per minute. It's also stored at more frequent intervals onboard.

2) Dallas Semiconductor "Thermochrons", which is a self-powered temp sensor with internal clock and memory. About the size of 5-6 dimes stacked on one another. Looks like a big mercury battery. You can program them ahead of time for stop/start/interval, then place them in your payload.

This supplier claims to have them in stock - in the past, they have been difficult to find. Backorders tend to take forever.
http://www.embeddeddatasystems.com/page/EDS/CTGY/TCTC

You will also need the reader unit, and there is free Windows software for programming the buttons and downloading the data (Embedded Data Systems appears to sell the software, but it should be available free from
http://www.maxim-ic.com/products/ibutton/software/tmex/index.cfm).

Topic: 3941 Message: 3946

We (UTARC) use DS1820 / DS18S20 / DS18B20 digital sensors, they are the size of a transistor, and give very precise output. We have tested them down to -60C using dry ice, though their rating only goes to about -50. They use a 1-wire interface, and are parasite powered, which means they get their power from the data line. They are also addressable, which means you can attach more than one to a single data and ground line.

http://www.maxim-ic.com/quick_view2.cfm/qv_pk/2815

Here's a snippet of code to read the DS18B20:

http://snipplr.com/view/2189/picbasic-interfacing-18f-pic-with-temperature-sensor-maxim-ds18b20/

I can't recall which of the three versions is currently available, but if you have trouble using that code, just email me, there's just a slight change to make for the B or S models.

Topic: 3947 Message: 3947

Hi Joe,

The anaeroid cell used in the EOSS fast release was salvaged from a surplus VIZ radiosonde. You can still get those sondes from Herbach & Rademan online for $10 ea:

http://www.herbach.com/Merchant2/merchant.mv?Screen=CTGY&Store_Code=HAR&Category_Code=RAD

This style radiosonde is obsolescent, with NWS transitioning over to GPS based sondes which don't require such sophisticated ground stations for position tracking. The "compact" sonde shown on the same page may not have the same kind of mechanical barometric multiplexer.

I've also drawn a blank on other sources for anaeroid cells, although they're commonly used in consumer-grade barometers. Fortunately, we've got several spare sondes and anaeroids on hand if needed for replacements.

One of our member's XYL is working on an autocad drawing of the fast release device, so I hope that the design details of that prototype will be available at the EOSS web site before too long.

Good luck on your flights! BTW, the Vienna (VA) Wireless Society has an active balloon program, if you're interested in getting some hands-on experience before your first launch.

Hello all,

The Columbus NASA Connections program has launched and recovered its third balloon carrying student experiments. The recovery was visual, as we saw the double parachute system in deployment fall in front of us into a cow pasture. Some images and data are posted on the site below -- click on the DREAMS-3 link or pictures.

http://www.columbus2space.org

The total mass was 1900 grams and included a 440MHz repeater, 0.8W APRS system, carbon dioxide sensor, 3 axis accelerometer, 2 temp sensors, and a relative humidty sensor. Plots of these data will be posted after Christmas. Maximum altitude reached was 91,700 feet using a 1500g balloon inflated with 15 pounds of lift.

This email also serves the purpose of wishing you all a festive and/or relaxing holiday!

Ever upward,

3949. Checking In

Yahoo group: GPSL (2002 — 2008)
Date: 2007-12-28 01:48:39 UTC
From: Brek Brixius
Topic: 3949 Message: 3949

Well it has been a very busy couple of months here but I finally got a moment and I thought I would just check in with the group. :)

I think the last time I checked in with the group Angie and I were preparing to go talk to the Hot Springs Amateur Radio Club of Hot Springs South Dakota. Mike W5VSI was kind enough to send me a power point he had prepared for another gathering. Thanks again Mike, it was a big help with our presentation.

The Hot Springs club has a nice shack where they hold there meetings. Note the word small in that description. There were about 20+ showed up for the presentation and we litterally had the place packed.

Angie and I showed part of the NSTAR video Mark sent, we handed out Mike's Power Point, and passed around some of our BUNS hardware, photos from GPSL 2007 and a copy of Nuts & Volts open to one of Paul's articles. Then we talked / answered questions for an hour and 39 minutes.

Finally, we ate chocolate cake and had coffee.

It was a nice evening. They said they enjoyed it very much and I know Angie and I really enjoyed it. I don't know if we recruited any new balloonatics but, we made some friends and got to talk about something we love. That is pretty good in my book.

I hope everyone is enjoying the holidays. It has been cold and snowy in our corner of Nebraska recently. Good weather to stay in and work on projects.

I haven't been very productive with my projects I am affraid. I have an old ATARI computer. The RAM went out. 23 year old computer and it's already falling apart - go figure. Anyhow, I desoldered the old RAM, socketed the board and installed fresh RAM. It's going again. Of course it has to be tested properly. Games are the most demanding application for any computer. ;)

I have also been playing with the Picaxe 40X1. I don't have much experience with microcontrollers but this little guy seems very capable. I used a Picaxe 08M to control 3 cameras for my balloon at GPSL 2007. On that I had programmed several different firing patterns and rates for the cameras. I had to squeeze to get all that into the 08M's small memmory. The 40X1 is a lot bigger physically. Even so, its still compact enough to fly. All the I/O and more room for code are nice advantages too. At around $11.00 each the 40X1 looks like a pretty good deal to me.

Well, take care folks. Enjoy the rest of the Holidays and have a safe and Happy New Year.

Below is the announcement sent out this evening. We plan to launch on Wednesday night at 9PM Eastern (0200 GMT 1/3) and our path prediction looks to follow UX-19 going off the coast of NC/SC area before making a turn north towards Europe some time after crossing the coast into open ocean.

Please feel free to pass this info on to any groups interested.
Greg

Greetings,

Happy New Year to one and all. UTARC is pleased to announce its first trans-Atlantic balloon attempt, the Spirit of Knoxville II. It is our intention to launch from Knoxville Downtown Island Airport at 02:00 UTC January 3 (9:00 PM EST January 2). Local visitors are welcome to come to the launch. Here is a Google map of the launch location:

http://maps.google.com/maps?sll=35.962984,-83.87171

We also invite everyone to follow along with our new, enhanced live tracking system at:

http://www.spiritofknoxville.com/

Also, we are pleased to announce our new alert system, which allows you to sign up for email alerts when various flight conditions are met. Visit this site for more information:

http://alerts.spiritofknoxville.com/

DTRC users, we need your help! The DTRC status page (http://dtrc.utarc.org/status.php) will be updated soon with more detailed information. Your help is vital to our success. If you have any questions, just email us.

Thanks again, and Happy New Year!

The UTARC Team

Subject: Amateur Radio High Altitude Ballooning

Hi, my name is Don Franck, AD0F, and I am a member of the Rochester Amateur Radio Club (RARC) in Rochester, MN. We are in the planning stages of having a "mini- Dayton" convention on August 8 - 10, 2008. And was wondering if there might be some interest in the Near Space projects to come to Rochester for a possible launch. This convention will be hosted by us and is drawing on the Dakota Division of the ARRL. So, there will hopefully be thousands of Hams and public at the convention. I am trying to see of your group, and others, might wish to come. We should have ample room for you to do a setup demo or launch at this convention. And just plain, gee whiz the public.

So, if you think members or your entire group would be interested, please let me know. And if you could help get me in touch with other groups, I would welcome it. As this is a chance to show what we can do with some radios and weather balloons. It's real science and we should use every chance we get to let people know that!

Donald R. Franck,AD0F

On a side note, if anyone has old equipment they be willing to part with, I am looking to try for a launch myself at the convention. Or if someone is within driving distance who is willing to loan some for a static display, I would see it is returned after the convention. This looks to become a big convention (mini-Dayton) so thousands would see that this project can do real science. And we would have a chance to garner a large interest in this activity. So, please contact me either here at GPSL, KNSP, or my email address listed below. Thanks and hope to see you here in August!

3955. Spirit of Knoxville III to launch after 0000 UTC Jan 15

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-13 07:05:04 UTC
From: Dan Bowen
Topic: 3955 Message: 3955

The Spirit of Knoxville balloon team is pleased to announce the launch of Spirit of Knoxville III, which will occur between 0000 and 0300 UTC Tuesday, January 15 (7-10 PM EST Monday, January 14). As launch time is dependent on local weather, a final determination and announcement will be made on January 14 on the website news feed.

Driving directions are available on the Launch Info page, and in-flight updates are available on our Alerts page. A full-featured live tracking system will also be available on the website.

Please monitor http://www.spiritofknoxville.com for further details and a more precise launch time.

Thank you,
The UTARC Balloon Team

3956. Launch time finalized

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-14 02:08:33 UTC
From: gregwilliams@knology.net
Topic: 3956 Message: 3956

After reviewing the weather predictions, we are aiming for a more precise launch time (weather permitting) of 0200 UTC (9:00PM Eastern Time) from Island Home Airport in Knoxville.

Weather at 9PM Eastern, depending on the weather site you look at, averages out to the following:

Temperature: 33 F
Humidity: 57%
Dewpoint: 19 F
Winds: WNW 5-7 mph
Skies: Mostly Cloudy

DTRC users should be listening for a signal on 30 meters at approximately 0800 UTC (3:00AM Eastern Time) as the payload crosses the Carolina coastline and out into the Atlantic.

UTARC is still looking for stations on both sides of the Atlantic to monitor for the payload on 30m via DTRC (Distributed Tracking Relay Client). All you need is an HF receiver and a computer with a constant connection to the internet. Details and instructions are available at http://dtrc.utarc.org.

While over the US, the payload will be on the standard APRS frequency of 144.390. The 30 meter frequency will be approximately 10.126 LSB, +/- 1 kHz. The 30m frequency will be transmitting CW and RTTY.

For updates, to sign up for updates, or to track the balloon once in the air, please visit our web site at http://www.spiritofknoxville.com.

Its still transmitting, but bad GPS checksum. I dont know if thats only on the 2m transmitter or if it will carry over to the 30m if/when it gets out over the ocean.

We'll know when it gets there.

Greg

It is unlikely that the HF transmitter will come on. It won't activate unless the GPS bad data condition is corrected. At this stage, the most probable outcome will be that the balloon will fly on, passing out of the US in the early hours of the morning, at which point its VHF transmitter will turn off. The HF transmitter will not activate if there is no GPS data, and at sunset on the 15th, the balloon will fail to ballast and descend to the ocean surface, bringing the flight to a close. Any stations who are able are requested to listen on our HF frequency in case the system does recover.

I've never seen one, but the checksum is intended to detect noise on the NMEA serial data link. Could be RF on the line, but also could be a funky GPS or serial port on the 'puter end. It could also be a noisy radio downlink, but that's normally indicated by a packet CRC error.

As Zack noted, not a good sign.

Looks like our Mark Caviezel ZP balloon is faring better than our GPS, according to the digipeaters it is coming through, it appears to be nearing the atlantic coast after 3 hours. This seems to correspond with winds near 30,000 ft, according to HYSPLIT. If the balloon envelope alone can maintain a float until the next sunset, it is is possible that it may just be within VHF range of Newfoundland at sunset tomorrow evening.

Having programmed the flight computer, the VHF will not ever turn off in this condition, it will continue to transmit the error message every 5 minutes until the GPS recovers or fully dies. (Yes, it would have been nice to have the HF sending that too, but on that freq it could have been a pink slip here in the states) The flight computer can't tell what time it is nor where it is without valid GPS data.

Not sure if it is a GPS failure or flight computer failure, we'll run some software simulations over the next few days and see what there is to be learned.

3970. request for advice: GPS units for ARHAB

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-16 14:56:04 UTC
From: K. Mark Caviezel
Topic: 3970 Message: 3970

All:
I haven't kept up with what the ARHAB state of the art for airborne GPS units is. What units are being used now days? Factors of merit: low power consumption, cheap, lightweight, works at ARHAB altitudes, integrated antenna.
I'm considering getting some Garmin 18LVCs which at 5V/0.060A, $60, about 2 oz seems like a real contender but I know that unit has been on the market for several years now, maybe there is something better out there. Notionally, I'm thinking about flights in the 2-5 day range, so power consumption is a bigger driver in this application than short duration sounding balloon flights.

Your detailed suggestions are welcome.

- Mark ng0x

3971. TU Balloon flights 57 and 58

Topic: 3972 Message: 3972

We're running a little late, but Taylor University's High Altitude Research Platform's 58th flight is underway; callsign kb9znz-12. kb9znz-11 is down, and we are within about 25 minutes of recovery. The area looks pretty decent, and we're in the landing zone for the -12 flight!

Live from the TU HARP Tracking / Recovery Team, just outside of Marysville, OH,

3973. BASE 20 located!

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-21 16:46:56 UTC
From: BASE
Topic: 3973 Message: 3973

Dear friends,

BASE 20 has been located on the beach in Port Burwell
Provincial Park in Ontario. A Canadian man walking
the beach discovered the payloads on Saturday.

After reassuring him that the only liquid in the pods
was Lake Erie water, he is returning to the site to
pick up the system and return it to me.

Thanks to everyone that followed the flight,
especially Harry for his efforts to contact his friend
in St. Thomas.

Howard

The GPS 18 LVC (OEM) has worked flawlessly out here in Maryland (we have ~4 of them). I'm sure its obvious, but cut most of the wiring off as it weighs about as much as the unit itself (Garmin will still RMA if you cut the wires).

It seems to preform better than the other units we have tried as far as acquisition time, so it may be possible to turn it on for 3 min twice an hour and either sleep or unpower it for the other 90% of the flight. We have not used it in this capacity, but have a 15-20 hour flight this summer we are working towards.

Also, it works great on 3 L91 lithium AA batteries.

Ralph W0RPK maintains this page of GPS receivers that have passed or failed the 60kft test:
http://showcase.netins.net/web/wallio/GPSrcvrsvs60kft.htm

One note regarding the GPS-18 is that it seems to be more sensitive to RFI. I flew one in the same payload as a digital camera and the camera desensed the GPS unit by around 10dB or so. The GPS-35 I use is practically unaffected by the camera, but the tradeoff is that it's an older design and more of a power hog (about 130 mA at 5V).

The Motorola OnCore M12 is a pretty good board-level unit that works at 60kft+ and has good power consumption. The main issue is that you have to get the battery backup unit if you want it to power up with your configuration (output type, baud rate) intact. The default is their binary mode. This could be an issue in a long-duration flight where you may lose battery power at night and then regain it the next day with warming. The backup battery could fail too in such conditions.

That actually is something you may want to fully test on any GPS for a long-duration flight - will it retain the desired settings if thorougly frozen and powered off? Most of us flying daytime flights don't fully exercise these conditions.

Congratulations! That counts, technically, as a recovery for
Ralph's archives.

And it sure does highlight the value of including a "return to
sender" contact info on the payloads!

I'd think a CR123 LiSO2 cell would keep the GPS CMOS alive nicely even down to -40C, which shouldn't be too challenging an interior temp to stay above. The CR123's we use to power our NiCr cutdown burners have little thermal insulation and zero power dissipation inside the parachute canopy, and they've always fired over 5A on command.

Whether the GPS will operate that cold is another issue. Although the GPS engine could be kept above its min ambient, a GPS patch with a preamp may not enjoy such a comfy environment, especially if it's mounted outside the payload housing. A passive antenna would be preferable, I'd think.

3/4" thick Styrofoam is transparent to GPS signals, so you can keep the GPS inside the capsule but near the top of it to stay warm.

But, this all depends on the payload use. We here at NSS learned this the hard way last fall. This unit does NOT like 439.25 ATV signals. We found this out from others after the flight also.

Ralph? how about a sub catagory of the GPS list, that gives flight results. like i know we have the list of what ones work above "X" altitude. but maybe a list of what ones don't like certain modes or freqs. and or power levels etc?

Joe

Joe -- This would be interesting information but it is anecdotal in nature, very time consuming to
collect and very difficult if not impossible to maintain in a complete balanced view. I would add
brief results from specific lab testing which takes modes, bandwidths, power levels, radiation
patterns, proximity, et al, into account. The complete story would have to be in group ARHAB web
pages. -- Ralph W0RPK

Maybe a "This is what happened area?

Reason stating, is as soon as i made a comment about this GPS locking up, (probably desence) Bill ELK knew that that unit does not like 439.25 ATV. and it has failed on other flights with other groups when used on a video flight. It would be something that would have been good to know beforehand. that others have had problems with it, and it would pop up a red flag. as something to pay super close attention to. After 45 flights this is the first time we have ever had a problem with any GPS unit we have ever used.

Just a thought

Another contributing factor to jamming problems is an active antenna.
Strong out of band signals can cause intermod problems with the antenna
LNA. The higher voltage/current antennas generally perform better than
the newer 3VDC low current antennas. It all comes down to the IP3 of the
LNA. A good quality GPS antenna with filtering really helps. The $10
Chi-Com specials are pretty poor.

While anecdotal, I think there seems to be enough evidence that the GPS-18 is more touchy than 'usual' about RFI. I agree that for many units where boards, antennas, etc., may vary, it'd be too hard to track all the permutations. But for integral units like the all-in-one mice and handheld units, it'd be a worthwhile footnote to caution the operator to fully investigate RFI issues where they've been reported on multiple occasions.

I didn't realize until reading the last few posts that the GPS-18 also suffered from problems due to UHF ATV transmissions. That paralleled my experience with degraded performance in proximity to a digital camera. I now have mine relegated to the backup payload in a somewhat more benign RF environment (appears infrequent 2m transmissions don't upset it). I'll definitely keep the UHF ATV experiences in mind with this unit. Probably would not be good to pair it with a 70cm simplex repeater anymore.

This is truly amazing that Lake Erie gave the package back and so quickly. Would love to see photos and a post mortum on what can be salvaged.

I've had great luck with using the Motorola VP Oncore with 70 cm ATV....and the Garmin GPS-35 as well. However, the GPS-18 LVC takes some work to get it to work in that environment.....we did manage to get it to work on the last UAH Balloonsat by putting it about 3 feet above the ATV transmitter section with aluminum foil between them....I wasn't able to check to measure just how much desense we were getting but it did perform well throughout that flight.

The following output sentence might be helpful to determine if you have desense problems with your GPS receiver or antenna....see if the signal to noise values on the tracked satellites change dramatically when turning on other transmitters or equipment in your payload:

The $GPGSV message field 7 gives you the signal to noise ratio on tracked satellites.

In addition:
The Garmin Specific $PGRMT sentence will give you the GPS unit's internal temperature....since the GPS unit is often placed right out in the open....this would be a good parameter to measure particularly if doing a night flight.

This whole thread about GPS performance is a real good one.

Mike,

Could you provide some context and specifics about the above
two observations, please?

Anecdotes, whether this was something you or someone you know
experienced, whether it was on board a balloon, stuff like that.

Hank

Our GPS antennas are mounted inside the top of foamcore enclosures,
and they do work. But we have observed some loss of signal quality -
not enough to lose 3D lock, however. Past performance does not
guarantee future results, however :=}. So I was reluctant to
suggest that, especially since we've not verified that an enclosed
GPS antenna/rcvr in fact does operate OK overnight.

EOSS had the same problem when our 426.25 ATV xmtr shared the same enclosure as the GPS. Problem solved when we put 'em in separate packages separated by 10-15 ft of payload line. Steve KC0YA proved that we could put GPS-derived data on the ATV downlink overlay using a 900 MHz Zigbee link between the payloads - but 433 Mhz Zigbee went belly up when the ATV was QRV, even 10 ft away.

We think the GPS QRM is 3rd harmonic or simple front end desense.

Fortunately, ATV QRM to GPS can generally be evaluated on the deck
by looking at the NMEA strings that show signal quality. Compare that
data with ATV on and off, in a reasonable replica of the flight config,
of course.

If you folks are interested in testing GPS performance in cold weather, let me know. I live in Fairbanks Alaska where the winter temperatures commonly go to minus 40 below (-40F). I can open my front door and set a GPS down on my deck and monitor "real time" performance. Ditto for all kinds of battery life too. I can tell you exactly how something behaves during a 100K balloon flight while keeping both feet on the ground.

We have never used ATV so I can not speak to the issues on 70cm. We have however used it in close proximity to 2m (APRS), 900 MHz, and 2.4 GHz signals along with some modern metal shelled cameras without issues.

3995. GPSL 2008 Conference, First Call for Presentations...

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-30 14:05:58 UTC
From: Keith Kaiser
Topic: 3995 Message: 3995

Aeronauts,

In order to plan for the best possible GPSL experience I would like to ask those interested in doing a presentation and those interested in having a static display to please give me a heads up. I don't need your paper yet but if you have some idea how much time you would like 30 minutes, 60 minutes, etc., let me know that and maybe the subject of your talk. If you are interested in having a static display which will be up Thursday afternoon until Friday or maybe even Saturday afternoon please let me know about that too. Specifically I would like to know how much room you think you need and again the subject matter if possible.

Please send this information to keith.kaiser@...

Dates:
July 31, 2008, Thursday @ 1:00pm static displays open
July 31, 2008, Thursday @ 9:00pm tour of Pillsbury Observatory
Aug 1, 2008, Friday @ ?? Presentations
Lunch
Prelaunch Briefing
Aug 2, 2008, Saturday @ ?? Launch and recovery
Lunch
Post launch briefing
Dinner
Fun
Aug 3, 2008, Sunday @ ?? Reserved as the weather day, or going home

3999. Re: [GPSL] GPSL 2008 Conference, First Call for Presentations...

Yahoo group: GPSL (2002 — 2008)
Date: 2008-01-30 17:27:29 UTC
From: PAUL VERHAGE
Topic: 3995 Message: 3999

I'd be interested in a static display. I'd also like to present on BalloonSats this year.

Thanks,
Paul

>>> Keith Kaiser <keith.kaiser@...> 01/30/08 7:05 AM >>>
Aeronauts,

In order to plan for the best possible GPSL experience I would like to
ask those interested in doing a presentation and those interested in
having a static display to please give me a heads up. I don't need
your paper yet but if you have some idea how much time you would like
30 minutes, 60 minutes, etc., let me know that and maybe the subject
of your talk. If you are interested in having a static display which
will be up Thursday afternoon until Friday or maybe even Saturday
afternoon please let me know about that too. Specifically I would like
to know how much room you think you need and again the subject matter
if possible.

Please send this information to keith.kaiser@...

Dates:
July 31, 2008, Thursday @ 1:00pm static displays open
July 31, 2008, Thursday @ 9:00pm tour of Pillsbury Observatory
Aug 1, 2008, Friday @ ?? Presentations
Lunch
Prelaunch Briefing
Aug 2, 2008, Saturday @ ?? Launch and recovery
Lunch
Post launch briefing
Dinner
Fun
Aug 3, 2008, Sunday @ ?? Reserved as the weather day, or going home

From: wb8elk@aol.com
Topic: 4000 Message: 4000

Hi Keith,

Put me down for at least 30 minutes...although I could probably go for an hour if you have the time....Topics will be: Long Duration flight techniques (Cross-Country and Trans-Atlantic crossings)

Also....a small table for static display would work.

- Bill Brown WB8ELK

4001. Flashing visible light beacon

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-02 22:27:35 UTC
From: BASE
Topic: 4001 Message: 4001

Dear friends,

Our next flight will include a pre-dawn launch to
allow a student ELF radio to look at signals before
sunrise. I want to have a flashing visible light
beacon on the flight string during the ascent.

Does any one have any suggestions?

Thanks,
Howard

Howard I bought a Xenon strobe several years ago from Into the Wind,
I believe that was the name of the kite company.

I found the paperwork that came with the unit and it is a "Lightman"
product and here is a link to their web site:
http://www.lightmanstrobes.com/basic.htm

I have used it several times for night launches in High Power
Rocketry and it also has been used one time during a 4am balloon
launch.

It says in the specs that it is visible for over 2 miles on the
ground. During my balloon launch it was visible for more like 15
miles. It survived the flight just fine. I did use 2 AA Li
batteries.

Taylor University uses 4 Lightman strobes (2 LED and 2 Xenon) for our early morning launches. They've flown 3 times, and have been blinking on the ground when we got there each time, using Li AA batteries, as mentioned.

Overkill, perhaps, but our students enjoy the light show.

Nicholas,

A question for ya. Did the flight with the balloon have a GPS/APRS system onboard? Reason asking is we had a flight similar in nature as yours described below, but the APRS/GPS system was very erratic. It did work, but, the position was off simetimes by 50 miles, only to return to the actual location, and even sometimes it was as high as 43000 feet below sea level also.

We later learned by many that the error was from a coronal arc of the strobe getting into the GPS system.

Joe,

Yes the package contained a Rino 110 that was the GPS engine
for the package. It also had an APRS system using a TT3. We had no
problems with the system. We never lost lock and never had any
readings of either location or altitude that were not normal.

The Lightman strobe was hanging on a tether about 3-ft below the
package. This arrangement was necessary because there was no room
inside my Rino/APRS package.

Ralph: You forgot to mention 'heavy' as well!
FWIW, I am in the process of getting a white and red
LED light set certified for manned use. Current
lights used for manned balloons use incandescent bulbs
and are power hogs. I was absolutely stunned to hear
a man (FAA certified balloon repair station and seller
of such a device under STC) recommend unscrewing the
continuously lit bulb from the light set he sells,
because the power consumption is too high with it on.

In the gas balloon events, flights of over 48 hours
are common, so a power miserly light set will be an
advantage.

Joe's right. If you're using a Xe strobe tube, the main discharge cap voltage usually exceeds 300V and the ignition electrode voltage hits several KV. Any metal at those voltages and exposed to air is susceptible to coronal discharge at low ambient pressures. Corona is a wideband pulse emitter and could easily honk GPS reception.

This problem can be averted by keeping the air away from the live metal using corona dope (thick acrylic paint) or by switching the strobe off at altitude using a baroswitch, as was done by Norm Kjome of U Wyo. It also help to round off any sharp metal points carrying the HV.

Best to check for corona in bell jar to see where it's happening and to verify the effectiveness of any countermeasures.

Of course, high brightness LEDs operate well below the 250V corona onset voltage at altitude.

If you're flying non-exempt, then FAR 101.35(b) applies.

4011. Canon PowerShot A560 for ARHAB

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-07 19:55:15 UTC
From: Mark Conner
Topic: 4011 Message: 4011

Some of you may have seen a notice on either the GPSL or ANSR e-mail list regarding using the CHDK software to program several models of the Canon PowerShot series. After doing a bit of reading on the site (http://chdk.wikia.com) I decided to start trolling eBay for the appropriate models and finally hit on an A560 for about $85 plus shipping.

The A560 is a 7.1 Mpixel camera. I just got it yesterday and tried it out. The pictures are not quite as good as my 6 Mp Canon digital SLR, probably due to smaller and inferior lenses. However, it's much better than any point-and-shoot models I've tried to date (Aiptek and Concord models, Canon Powershot A300). The camera is much smaller and lighter than expected - it is roughly the size of the Elph but with a bump on the right side for a handhold/space for second AA battery. It does have an optical zoom, and the lens is at near full extension (~1.5") for the wide-angle setting. This can complicate mounting. It does have a DC input jack roughly the size of most modern cell phone charge jacks which takes 3.15V in. That may be handy for putting the batteries in a warmer place in the payload and increasing their size (unknown yet if a set of NiMH or lithium batteries will work for the entire flight).

The CHDK software will let you script camera commands with incredible detail, simulating practically any menu option or button press you can do interactively. You can also control ISO settings, focus, zoom, exposure, etc. There are several scripts available for taking images at intervals, and the scripting language is an easy-to-understand form of BASIC.

There is even the ability to do motion detection which is fast enough to detect the leader stroke of a lightning flash and open the shutter in time to capture the main stroke(s) a few hundred milliseconds later.

Since you do not have to modify the camera in any way (removing the software from the memory card returns the camera to normal operation), this means you can use the camera for other than ARHAB purposes. I plan to use it for creating time-lapse movies and taking lightning pictures if it's fast enough (some models can't quite go fast enough for that).

I should have this camera ready to go for our first NSTAR flight on March 29th at the Severe Weather Symposium in Lincoln. I'll also post further updates as I get experience using and making scripts.

If you choose to get a camera, check the CHDK site to make sure the particular model is supported. I believe the A560 is the earliest/cheapest model supported. Expect to pay at least $80 for this model, maybe into the $125 range for the A6xx models. Plenty of them, including new-in-box ones, can be found on eBay at any one time.

From: Daniel Bowen
Topic: 4012 Message: 4012

Hi All, you may have heard already, but a nice article was written in a local paper about UTARC's Spirit of Knoxville transatlantic balloon program. The article is fairly in-depth, fun, and surprisingly accurate for a technical subject gracing the pages of a newspaper. The writer worked with us for weeks in many interviews and came to a launch as well. Several groups and balloonists are mentioned, including EOSS, NSS, Ralph Walio, Robert Rochte, Mark Caviezel, and Bill Brown. The Spirit of Knoxville is the feature story of the issue, and has a nice line drawing on the cover, which is visible at http://metropulse.com . The story itself will remain available at:
http://metropulse.com/articles/2008/18_06/coverstory.html
You can keep up with our SNOX program at http://www.spiritofknoxville.com. All flights from here on will be HF-only, so no FINDU tracking will be available, we have a live google map on that site for tracking.

Thanks,
Dan Bowen

Topic: 4010 Message: 4014

From Joe, WB9SBD of Near Space Sciences.

I've been in this high altitude ballooning this August for twenty years. And have helped many other groups "Get off the ground" so to speak.

As well we have gotten help from many others with cool ideas and new technologies also.

The Article mentioned below is cool, but we also find it troubling, about that later..

We here at NSS have been "Playing" with the idea of a long duration flight since probably 1990 or so. Our first attempt was using the technology from "EarthWinds" And a simple beacon made by KA9SZX, a simple CW message with a diaphragm from a weather sonde controlling a slide potieometer, that varied the speed of the CW message. by timing the message's interval we could determine the altitude.

a problem we forgot to account for was COLD, the cold effected the resistance of the slider pot resistance strip, and dropped it drastically, thus increasing the speed to almost a un decipherable speed.

no one by ear could copy it, it almost sounded like a packet burst.. people with computers were monitoring it, and were able to make the timings.

No GPS on board so exact locations were strictly by beam headings. and altitude was by the message interval.

Liftoff was at 8 am, on a Saturday morning. within a hour we knew we had the problem with the speed thing, but we were suspecting the balloon system was working as hoped, because the speed has plateaued out at about 55 words per minute.

But we thought did it actually level off? or is the resistance so low due to cold that it just can not go any lower. we knew only time will tell,

2 hours into the flight and signals still strong heard by many all over the mid west.

Ok it had to level off it is now 7 hours into the flight and still strong signals.

now for the moment of truth,, 9 hours into the flight and sundown is happening, and signal still there weaker but still copyable. we have the beam heading of due east, triangulation with many other stations puts it just barely into Michigan state,

At the 12 hour mark we loose signal. but from the HF net stations in Michigan, PA, NY etc are still hearing it.

22 hours after liftoff stations on the east coast are still hearing it, and are putting it someplace over Maine.

last station to hear it was a station from Maine with a beam heading of about 60 degrees, at 10 PM CST on Sunday evening. That was the last we heard from what we called "EarthBreeze"

With the recent elevated interest in the long duration flights, we though lets try again especially the technology has improved so much as far as tracking possibilities goes, NSS thought sure lets try. Don't care about the competition, just the effort.

We think we even have improved on our balloon technology also. But the payload was killing us. Both in costs, and newer technologies too. especially the HF long distance tracking stuff.

So, we think we have a workable balloon platform system but no payload suitable for a crossing attempt. And the window for the crossing attempt for this season is closing rapidly.

So after watching with interest the other groups with their attempts, and the ones that seemed the most eager and going hard for it was the "Spirit Of Knoxville" group.

They had what seemed a great payload, but a balloon system that has had it's fair share of problems.

We at NSS contacted them, and more or less proposed a "Joint Venture"

They have a awesome payload in need of a balloon system,,

We think we have a balloon system in need of a payload.

And the offer was proposed for a "Joint Mission"

And all seemed like they were interested in working together, till our last communication, on Jan 6th, a copy is below,,

Hi Dan and all the rest,

Joe WB9SBD here, Answers below

Dan Bowen wrote:

> Hi Joe, Brad, Steve,
> We respect your need for secrecy, as we have some of the same needs as
> we are in competition with several groups to become the first amateurs
> to send a small balloon across the atlantic ocean.

I am glad you understand the secrecy part. It's not so much as a decision on our part, but of a design part. UG, sorry can not say more.

> We are flattered with your respect for our achievements and skill,
> however, we do need to have some assurance that your project is not in
> direct competition with our goals.

And I guess theres the rub, we have been somewhat I guess lurking in the weeds on that part. We have been working on this same goal, for well over ten years ,if not longer. Flew many test flights, (seemed like regular flights to everyone else) but sub systems were tested. Then with time for this years missions running out, for the crossing missions. Is when and why I proposed a "Joint Mission" you guys seem to have an awesome payload. We have a balloon system that in only two ways the mission could fail. One is of a mechanical way, (but highly doubtful due to the simplicity of the design) And the other is in a materials way, (This one we have no clue as to yet for the material has never been used in this way)

Like i said in the initial contact,, You guys have awesome payload designs,, looking for a ride,, we have a balloon in need of a better payload.

> We don't need to know any details of your hardware or envelope, but
> before we go further, can you tell us about the classification of the
> flight - is this going to be amateur or commercial

Absolutely strictly Amateur.

> and are you going to cross the atlantic before march?

We will be attempting yes, before the end of the month or early Feb. at the latest, one way or another, even if it's just a MicroTrak-300. sometime before early Feb. it's leaving. But since we do not have time to research and make up the super payload, and,, when Mike said you're more or less on hold till you get another balloon. That's when I offered the "Joint Mission" project.

We also are in waiting for one more material for the balloon to arrive. and depending on your all decision, a ordering on one of those small solenoid valves, we are ready to go.

Looking forward to your thoughts and decisions.

Joe WB9SBD
Near Space Sciences

We at NSS never got a reply,, so iguessed since we were in a somewhat "Competition" Even though NSS was not actually, They didn't want to share a crossing if it worked. Then, when this article comes out We were quite suprised as to some of the statements made.

"Then there's that mystery group that came out of nowhere," Williams says. Near Space Sciences (NSS), a co-op of crafty science geeks from Richland Center, Wis., is a relatively unknown force to be reckoned with in the race to become the first privately-funded group to send a weather balloon across the Atlantic. The group contacted the Spirit of Knoxville

crew to deliver a single message: "We're going to beat you."

20 years of flying and we came out of nowhere?

And we NEVER said anything even close to resembling a single message of we are going to beat you,

We had a exchange of at least a dozen E Mails discussing the possible "Joint Venture" and all looked good until that last message exchange as seen above. Then silence.

The first part of the comment about NSS in the newspaper is somewhat complimentary, But, we found the last comment discourageing. As if we were in the competition. And that beating them was never said.

We will still eventually fly, it may not be aborder crossing this winter,, or ocean crossing,, maybe it will be in the summer instead, where we will maybe put up a repeater and gps system when the winds are at their slowest. just to see how long we can keep it up and still have it be a "Local" bird.

Take care everyone, the web page for the results of NSS-45 is almost ready. we will announce it when done.

Take care everyone.

Let the Flames Begin?

Keep in mind that feature article writers can have a tendency to "enhance" some of the details to draw in the reader. A lot can be lost or changed between interview and published article.

Only have flied three PE zero pressure balloons, never even thought of
that. could be a problem i suppose. but our chase and recovery teams
were always at the landing sites of those flights anyway, so, hmmm?

something to concider. and add when we fly next.

4018. Recent E Mails,

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-09 19:17:20 UTC
From: Joe
Topic: 4018 Message: 4018

First off,
I would like to apologize for any misunderstandings, that our recent E Mailings may have made.

Yes we do keep a somewhat LOW profile, so many of the other newer groups may not know of us.

And our web page has not changed in probably years.

But then at the same time our recent flights have been on all the groups in big amounts too. like live streaming of the audios etc.

Anyway, What started this all was that newspaper article. And the comment about "Beating Someone"

That did hit all of us here at NSS in a deep hearted way. We were not in the "Competition" we do this ballooning just for the love and fun of it.

If we were in it for the "Competition" and glory of being the "First" obviously our web page would show this to be true. And it may not be probably ten years out of date. We just don't care about that stuff. Hell we have done flights where the only people that even knew about them was like three of us? We are just not into the glory aspect of this.

In the true nature of Amateur Radio, we offered to another Group, to join forces, to work together for a common goal. And to achieve this goal together. But when i guess the "Competition" aspect came in that was not to be. Even with the Competition in tow we would still been happy to join forces with this other group on the joint effort. but they apparently did not want to.

And i had no problem with this. The problem we had was the false statement of us telling them we were gonna beat them. That is the problem.

Our group in no way is into the competition, never has, hence the poor record keeping of flights, altitude, duration, distance etc. anyone remember the flight from Hillsboro WI. that went to Ohio/Indiana border, then came all the way back to Illinois and landed at Ohare? Like a 14 to 16 hour flight, and possibly ohhh, a 600 mile trip?

Yes now days that's not even close to being a record any more, but i bet in the late 80's it probably was. We just never said anything about it.

We've built payloads for the Rockets For Schools program, Where a super-loki sub orbital rocket flight is done for schools. Never said anything about it.

We've flown experimental payloads for retired NASA guys working on the X Prize, just never said anything about it.

We are not into tooting our own horn. It's just the way we are.

But we don't like "Press" that is published that makes us look bad. And that is what started this whole thing.

I admit, even this E mailings may make us look bad, and petty, but when something is published that is in no way truthful and negative about your group, it's like a direct attack on our families.

We love this activity, probably only to be exceeded in level of LOVE by our mentor Bill ELK. It's all we think about, to the point even our personal lives sometimes has suffered from it. if we had the cashflow, we probably would be closing in on 1000 flights so far.,, ok thats an exaggeration 20 years 52 weeks a year equals,, uh ok i proved myself wrong, that would be 1040 flights,, he he he,, we are just a small group of folk, 4 main core, and Linda my wife is one of them, so we got us two and two others, And that's it as far as funding for these flights,, and this part of the world it's a quite depressed economy area. a job that pays 8 a hour is a awesome paying job, and you need skills far exceeding it to even have a chance of getting it. but that's our personal flight problems.

We just offered in the spirit of Amateur Radio In the Spirit Of "Elmerisim" to work together. I guess sadly, in this aspect of Amateur Radio, working together for a ballooning goal, is QRT.

Now that the Cat IS out of the bag,, about us here at NSS working on the crossing attempt. Even though that was also one of the request's we asked when we offered to join forces we wanted our involvement to be kept an absolute secret. In which it was agreed upon. sadly even that was not respected for about a week after the joint venture was offered, we had a e mail from someone not associated with either group asking about our attempt. so much for honoring our request for it to be kept between the two of us.
So, now that everyone knows what's going on here,

We make the offer, we think we have a balloon technology, in need of a payload,, anyone with a payload that wants a ride?

It's taken us probably 4 years in development of the balloon. And huge sacrifices on all our parts to make it a reality, we have invested in the balloon materials alone well over $500.00. hence the No payload for it to fly.

We have if the balloon fails and a "Typical" flight profile happens, 3 to 4 hour flight, we have a 100% recovery rate, 45 flights and every one recovered,

Now of course if the balloon is a success, you won't be getting it back unless it lands someplace in the world where it can be found and returned.

so the offer is out there, we are still willing to give a group a ride.

Hi Joe,

I do this for the fun and the challenge of pushing the "envelope" as you might know...And as you also know, I've been trying longer and longer duration flights in the eventual goal of sending one across the Atlantic and also across the country....I'm open source about that information and I will share my knowledge with any group.....I help the other groups attempting the Atlantic crossing if they ask for advice, honestly helping each other out will make it possible to do the crossing.......for me it's not a competition, I just want to see someone do it. Some really neat techniques for ballast systems and HF telemetry methods have come about from this effort and in the spirit of the ARHAB community, I hope that information sharing remains part of this.......I understand that healthy and friendly competition drives a team or group for extra effort for a goal (I particularly think that trying to achieve a new goal on Ralph's ARHAB records page has driven some real pioneering ballooning efforts).... so that to me is ok too as long as long as fist fights don't break out <smile>.

Just my humble opinion and not that of UTARC, but there was nothing incorrect about the article regarding NSS or any other group we mentioned. EVERYONE trying is out to beat us. Everyone trying wants to be first across. Just as we want to be first and beat everyone else. It's called "competition".

I've not had any notion that any one group has had ulterior motives over another when sharing information nor was it intended in my quote in the article about them coming "out of nowhere". I don't think anyone should feel the article sheds any negative light on anyone or any group.

It shows a competitive spirit that has driven all groups trying to make it across and it has shown that when there is competition, there is drive and determination to best one another. Pushing the envelope can inspire people to take an idea and then make it better.

The only thing missing though is an X-Prize reward. I still think gobs and gobs of money would be good. If anyone has any sponsors with money burning a hole in their pocket, be sure to tell them about this effort by everyone, not just UTARC.

That or free margaritas and steak.

The question has come up "where is GPSL 2008 being held" which seems a reasonable question. The only reason I haven't made a big deal about it yet is because we are still trying to nail down some specifics. But at this point it looks like we will be holding the conference and display areas at William Jewell College in Liberty, Missouri. For those of you not familiar with the KC area, Liberty is just North of Kansas City on I-35, click on one of the proposed launch sites and you'll get a nice view.

Keep the comments and dialog coming folks, and thanks to those who complimented the web site... superlaunch.org

4029. Launch site selection

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-12 15:31:41 UTC
From: Mark Conner
Topic: 4029 Message: 4029

I know we have over five months to work this, but doesn't hurt to start thinking about this now.

Many previous GPSL events have had landing sites south and/or west of the launch site. If the winds are like that for this year, using a launch site near Liberty MO will not work as we'd land well into town. Going east into Missouri could be a problem as the region is much more wooded than we typically see in Iowa, Nebraska, Kansas, or Colorado.

Other balloon groups (HABITAT, NSBG) have used sites southwest of Olathe in the summertime, around Edgerton or Ottawa. Edgerton might be a little close in a light-wind situation, but Ottawa should be far enough. It's also more comfortably distant from KCI and any other busy airports in the KC metro area.

There is a school in Ottawa on the west side of town that has a larger parking lot and what looks like a lot of open space around, plus there is a municipal airport south of town too.

Ottawa is a over an hour to the Southwest of where we will be, seems unlikely anyone would want to drive that far for a launch. Plus our experience of launching in this area and that time of year puts a landing almost in downtown KC so at least this time it's not a real good choice. We have used the Fountain Park location for many launches and at least up till now (knock on wood) our landings have always been within 20-30 miles in the farm lands between Karney and Lawson, MO. Flying to the Northeast but you are right we have had due East flights as well but usually only the early Spring flights.

Thank you for the feedback on this issue, I will bring your note to our next planning meeting to share with the rest of the team just in case I don't know what I'm talking about (could be). I sure can't promise you a corn field landing like in Iowa, but the longest searches we have ever done was in that very Iowa corn field, this should be easier.

From: Mark Conner
Topic: 4029 Message: 4032

The problem is that we will need alternate selections scouted ahead of time to cover any wind contingency. For example, for GPSL 2005 in Omaha, we had two sites selected - one about 40 minutes east of Omaha, and one about 40 minutes west. Between the two, we had practically any contingency covered, from light winds where the balloon could go a few miles in any direction to a straight line in any direction for tens of miles. We also have to accomodate the spread in landing sites due to different burst altitudes and ascent rates (typically around 10-15 miles).

In 2007, we had to make a last-minute change due to an unforseen wind circumstance (landing sites would be too close to I-80 and/or the Platte River). Fortunately we found the shooting range in Doniphan that was suitable.

Speaking only for myself, I'm willing to drive more on Saturday morning to avoid landing issues. I also prefer corn over trees, but that's just me. :)

Great job on the website, and looking forward to August.

These are excellent arguments and I agree we do need at least one
maybe two more alternate sites just for the reasons you give. Keep
checking the web site, when we have found a couple I'll post them.

Thanks for the feedback Mark.

I've emailed Joe directly and mentioned an alternate email, so if there's any problem with yahoomail, we'll get to the bottom of it.

It's certainly not overflowing, and getting a good amount of incoming email every day, so I'm not at all sure what this is about.

From: Gene Harlan
Topic: 4035 Message: 4035

For those of you that have seen VHF Communications before, you know that it is a great technical publication. It is a quarterly publication covering VHF, UHF, and microwaves. There are many construction articles primarily for the higher frequencies. I learn something every time I read an issue.

Harlan Technologies is the USA distributor, and we will be happy to take your subscriptions. Subscriptions are $44.00 per year (2008 rate).

If you are not familiar with the publications, the publisher Andy Barter has sent a few sample issues to try and get the USA subscription interest up. If you think that you might be interested in subscribing but just not sure, send me your mailing address and I will be happy to send a sample to help you decide if you would like to subscribe.

When they are gone, that's it. First come, first to get the samples.

4036. Results of the bubble-wrap thermal test Oz-12 and Oz-13 flights now online

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-19 07:59:59 UTC
From: wb8elk@aol.com
Topic: 4036 Message: 4036

I used these flights to test out the exciter transmitters for the trans-Atlantic flight coming up next month as well as the thermal performance of using only bubble-wrap as payload insulation.

Oz-12: 8 milliwatts on 28.175 MHz FSK RTTY
Oz-13: 8 milliwatts on 144.345 MHZ FM AFSK RTTY

Results now online:
http://www.wb8elk.com (http://www.wb8elk.com)

http://www.wb8elk.com/Oz13.htm (http://www.wb8elk.com/Oz13.htm)

I think folks will be interested in the performance of the minimalist bubble-wrap thermal performance on the results graph.

Reception of the Oz-13 8 mW 144.345 FM RTTY transmitter was reported from 200 miles (W4HTB in Bowling Green, KY) and at 300 miles by KA9UVY in Mt. Vernon, IL

Hi Bill,

What's remarkable about the OZ-12 3-layer data is that the internal temp actually ROSE from 15C to 35 C until it hit the tropopause. The "Icarus Effect" perhaps? :-}.

OZ-13 2-layer data exhibited the expected drop in temp with a thermal lag.

Kinda neat way to provide both thermal and mechanical isolation of small packages. We'll have to give it try on cheap DVR that's caught the flu both times we've flown it,

4040. Pillsbury Observatory @ GPSL 2008

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-22 21:16:21 UTC
From: Keith Kaiser
Topic: 4040 Message: 4040

Aeronauts,

I had an opportunity to visit the observatory the other night, in fact the night of the eclipse of the moon....very cool!

I met with our representative from the school and was shown around the facilities and of course Deb and I got to peek through the telescope too. One of the things we need to have at least a rough idea of is the numbers of people who might like to go see the observatory on Thursday night July 31. If you think this is something you want to do, please send me a note with the approximate number of people in your family or group that will be attending. I won't hold you to the number and I don't expect there to be a problem but I need to get a handle on what the count will be for planning purposes over at the college.

The observatory visit is open to everyone, your significant other, your kids, your grandma if she is interested, so a quick number from you will go a long way in our planning.

Thanks....

4041. Amateur Radio High Altitude Balloon forum on schedule at Dayton Hamvention

Yahoo group: GPSL (2002 — 2008)

All,

I managed to arrange a dedicated 1-hour forum slot for Amateur Radio High Altitude Ballooning at the Dayton Hamvention:
==========

Forum: Ballooning
Time and Day: 1315-1415 Friday
==========
For those of you attending the Dayton Hamvention this year, let me know if you'd like to present an approx 10 to 15 minute talk...or even just stand up for a couple of minutes to talk about your group. Let me know by mid-March as that is the deadline for the Speakers list.

4045. Balloon Telemetry Reception Question

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-27 20:30:22 UTC
From: Dan Wietchy
Topic: 3941 Message: 4045

Hello;

Although I understand that many of the balloon launches use either TinyTrak, Kam TNC (3+) or another independent radio modem, I'm curious what hardware and especially what software the ground stations are using to receive the balloon telemetry (Lat/Long/Altitude) information.

Are most folks using UI view for data reception?

thanks

Dan KL1JP

Hi Dan,

I can't speak for everyone, but we use UI-View 32 for all of our ground stations.
I have been playing with TrackPoint written by Nick Hanks N0LP from the EOSS group.

Thanks for the information. A few additional questions if I may?

Although I've got a Kantronics 3+ connected and it seems to be working correctly... after all - it seems to connect to the transmitting radio/TNC, I see nothing on the screen when using Hyperterminal other than the regular default connection info from the Kan (ie... the autobaud rate * communication, etc...).

Is there some command I need to send the Kantronics to throw it into Text reception mode so I can review and save exactly what the transmitting radio/TNC is sending? I'm fairly new to Kantronics so pardon my ignorance.

Also, when using the Kenwood TH-D7for receiving, I was under the impression that it only stored the last 18 data strings? How are you or others saving a continual stream of data from the TH-D7?

Thanks again

Dan KL1JP

Many are indeed using UI-View for plotting APRS reports from a balloon. I'm still using APRS+SA mostly due to inertia, although I do like the program very much even though development has pretty much stopped and the last compatible map database is about 6 yrs old now.
If you want just simple data reception (lines on a screen), a terminal program connected to your TNC will work.
I think the majority of users are using a TNC like a KPC-3 for hardware, which I also use. I use a TH-D7 as a backup and as a way to check the payload transmissions before launch without running back to the laptop in the car. There are quite a few who chase with just a TH-D7 or TM-D700 and no laptop.

Topic: 3941 Message: 4049

Hi Dan,

If all you are seeing is the autobaud "*" prompt, then it's waiting for
you to hit the "*" key so it can sync to your terminal's baud rate.
It may take several keystrokes before it syncs in - and then you'll
see the normal power-up screen showing 3 lines of text. Next step is
to set MYCALL - the callsign plus SSID for your payload. If the Li
batt on the KCP-3+ is good (<2.5V), then it will power up with the
power-up intro lines every time.

I've standardized on 4800 baud 8 data, 1 stop, no parity for all of
my serial devices. This is also pretty much standard for NMEA data
from GPS engines. 9600 can work, but I've found it to be less immune
to RF than 4800, and lower baud rates are noticeably slow.

My usual advice at this point is to find a comfy spot away from the
keyboard to browse thru Kantronic's excellent manual to learn what to
expect from the TNC and where to look to find out how to make it happen.
"If all else fails, read the book."

Now Hyperterm is kinda buggy - half the time I use it, I have to tweak
around with COM: ports and other settings. There are much better
terminal programs out there, and I think UI-View has a fair to middlin'
terminal mode screen.

Dan,

I highly recommend UIVIEW 32 with Precision Mapping software. We use it connected to a Kenwood D700 with a Garmin GPS-18 attached. It does take a little work to get everything configured correctly. After that, it is so simple that a Caveman and my 10 year old son can use it. My apologies if there are any Cavemen in the group.

Thanks.
I had to issue the following to the Kam3+
MA ON hit a CR
and then type in MCOM ON hit a CR

then it went into the correct mode.

Are you getting past the autobaud setup and able to send commands to the TNC? If not, you may have a communication issue between your computer and the TNC.

No, the data will just appear on the screen when it's received. You will probably want to save the incoming data to a log file (Transfer|Capture Text.. menu in HyperTerm).
> Also, when using the Kenwood TH-D7for receiving, I was under the

You can connect a computer to the TH-D7 or TM-D700 and have it function similar to a regular TNC/radio combo.

4053. BASE 21 - 1 March

Yahoo group: GPSL (2002 — 2008)
Date: 2008-02-28 20:59:02 UTC
From: BASE
Topic: 4053 Message: 4053

Dear friends,

BASE 21 will also fly early on Saturday.

Here are the details
(www.depauw.edu/acad/physics/base):

BASE 21 Flight: 2008 March 1

Launch: Crawfordsville High School, Crawfordsville, IN
10:30 UTC

Ascent Rate: target of 1500 ft/min

Burst Altitude: anticipated 90,000 ft

Landing Site: southeast of Columbus, IN approximately
12:00 UTC

Primary payload is an extremely low frequency radio
receiver, a Crawfordsville High School (IN) student
independent research project. Additional payload will
include APRS radio beacon at 144.39 MHz using W9JY-11,
and two digital video cameras.

Howard

4054. BASE 21 - 1 March brief report

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-01 20:31:59 UTC
From: BASE
Topic: 4053 Message: 4054

Dear all,

BASE 21 was a successful flight. Back-up computer issues and predawn assembly at 0 Celsius delayed the launch until 11:15 UTC. Steady climb at about 1500 ft/min, burst at 95,000 feet ASL and landing in southeastern Jennings County. Despite fast flight, tracking vehicle kept 900 MHz signal throughout flight until system reached 2500 feet ASL. Recovered signal as we approached the last known location.

Two troubles:

1) intermittent APRS radio beacon, I suspect a power supply wire connection issue. Schedule called for position report every 2 minutes with BASE-21 DePauw on every fourth transmit. This clearly did not happen. Last points (e.g., aprs.fi/w9yj-11) are at the landing site.

2) Entire system caught in two trees in small grove approximately 30 meters above ground.

Retrieval delayed until next week. For those keeping score, we're 21 for 21 with two lake landings and seven in trees above 30 feet.

Howard

4057. WB8ELK Indiana Workshop payload recovered near Lexington KY

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-03 02:40:07 UTC
From: wb8elk@aol.com
Topic: 4057 Message: 4057

I arrived at the landing site after midnight....as I approached the exit just north of Lexington KY, I could hear my voice beacon and could talk through the simplex repeater even though they were almost 2 miles away and as it turned out were all lying on the ground....(I had reports of stations in MI, IL, IN, OH and possibly IA and GA all working through the simplex voice repeater.)

Landing position: 38d 07.04m 84d 28.79m

Dr. Robert Downing of Lexington was kind enough to let me drive in at midnight to retrieve the payloads from his property.

I drove right up to a large metal garage and found the payloads and parachute lying right next to the garage building along a narrow 4-foot wide walkway very near where the FindMeSpot satellite GPS tracker was indicating....just over the fence to the right of the walkway was a field of knee-deep mud. I suspect that it may have landed on the roof of the garage and slid down onto the walkway.

The FindMeSpot payload was actually upside down and it's amazing it was able to send its position up to the satellite at all.

The cameras were all intact and all but one still camera took some great images...I'm still reviewing them all. The video cameras (RCA Small Wonder) apparently have an undocumented 60 minute max record time, even if the total memory available is 120 minutes....so we have great videos of the launch from various payload perspectives but the videos stop at around 48,000 feet during the ascent stage....we do have some great photos of the parachute descent from various perspectives and a couple of photos just a few hundred feet away from landing. We flew 4 Canons and 3 RCA video cameras looking up, down and at the horizon.

We were flying the Canon 7.1 megapixel A560 and A570 series digital still cameras with the CHDK intervalometer microBasic mod that was mentioned by Mark Conner a few weeks back. It works great and you can easily make the camera do all kinds of things with a few custom microBasic commands.

I found out why the WB8ELK-11 APRS tracker failed just after burst....I was testing out the lightweight Byonics SMA wire antenna and it was neatly snapped right off at the connector....so next time we will attach the antenna to a support rod.....it was actually still transmitting it's position when I got close enough to hear it without it's antenna. The second tracker (WB8ELK-12) failed at liftoff.

The FindMeSpot GlobalStar tracker worked great and as suspected stopped reporting above 60k feet, BUT came back to life again on descent and really saved the mission since it sent us the actual landing site within 10 minutes after touchdown. I'll post more on these results soon. It reports every 10 minutes

directly to the GlobalStar satellite network and shows up on a website....lat/lon but no altitude info. Their statement that it wouldn't work above 27,000 feet was unfounded as we had accurate reports right up to 60k feet both ascending and descending. This is a great alternative to APRS for final landing site location since it will report its position even when way outside the range of digipeater coverage.

I will be posting some select photos and maps of the flight path and landing site to my website later tonight.

- Bill

4058. Amateur Television Quarterly

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-03 17:23:35 UTC
From: ATVQ
Topic: 1887 Message: 4058

How time flies! It is time to start thinking about the Spring 2008 issue of Amateur Television Quarterly.

Articles are needed by April 1st.

Any good technical things going on for your ATV station or ATV repeater?

Is your club having any activities that involve ATV? Now is your chance to tell the world!

Any ATV DX going on in your life? If so, send pictures and info to Bob Delaney - KA9UVY at ka9uvy@... so he can write another ATV DX column.

We will have information about what will be happening for ATV at the Dayton Hamvention as the information is already coming in.

We will also have information about the ATV Contest for 2008. Any ideas for change this year that would make it more popular? I am open to hear what you have to say.

Got something ATV related to sell? Send the Want AD / FOR SALE items to be listed to atvq@... and they will be listed FREE space permitting.

Thanks to those that have already sent their articles in. I guess I better get started early!

Hi Joe:

Well everyone knows that is none other that Bill Brown, WB8ELK in his more youthfull days at Jeff's, KA9TGX's video center near West Lafayette, IN. Bill could probably center the date better than myself but would guess around 1989 or 1990. Jeff Kerssemakers had a full effects switcher including inputs from several cameras including one at his mailbox at the end of his lane and several satelitte feeds. Very impressive for any ATV'er that would catch him on the band.

4062. 7805 Regulator

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-07 18:37:31 UTC
From: Joe
Topic: 4062 Message: 4062

Hi All,

Just thinking here,, this is almost too simple but yet i don't know if anyone has tested one.

say the super basic 7805, we all have used hundreds of these,, on hundreds of flights, but has anyone ever tested them to see what they actually put out in voltage with the wide variances of temps we experience?

Anyone?

Joe

4063. Re: [GPSL] 7805 Regulator

Topic: 4062 Message: 4063

Hi Joe,

I use one in the AE0SS-11 module where we've measured internal temps
as low as -10C with no problems. But of course, since the 7805 is
dissipating power, its die temperature is gonna be a lot higher.
Mine is bolted to a 2" square sheet of 15 mil aluminum sheet as
a heat sink and dissipates an average of (8.6 - 5) x 0.25A = 0.9W.

I use the heat sink as a radiator, since at 10 mbar, there's very
little free convective heat transfer, so the risk there is the
die temp exceeding +150C rather than getting too cold. Bare Al
radiates far IR quite nicely.

Good point Mike, as far as it being warm doing it's job so to speak,

Hmmm, I wonder what it does if it was connected to something in a sleep mode where it could get cold, then have to regulate some. hmmm

From: Mike Manes
Topic: 4062 Message: 4065

Well, I think the plain vanilla 7805 is rated over just the commercial 0 - 70C ambient temp range with max junction temp of 125C for the plastic TO220 package. (The TO3 is good to 150C). However, I know that we fly a lot of comm'l temp range parts in our payloads, many of which dissipate pea-power with no problems.

If you're really worried, consider replacing the LM7805T with a LM140K in a TO3 package - it's good down to -55C. But be sure to have your D&B number handy when ya order :={. I'm sure there are newer +5 regs out there that are tighter, cleaner and run colder, but I'm not gonna look 'em up right now.

The best way to find out if your stuff works when cold is to cold-soak it and do a functional test. If you're confident that your enclosure will keep things above -15C, then a regular old food freezer set to zero F (-16C) will do the job. Just leave the unenclosed and unpowered stuff in there for a few hours along with a box big enough to hold it. Then pop the stuff out and put it in the box to keep it from warming too fast and test it.

You can use dry ice to get down to -80C, and that might be right for a payload that's gonna fly overnight with little or no power dissipation. But for a daytime latex burster, that's overkill; even the latent heat from pre-launch will keep things from cooling too quickly before you're back on the deck.

I've only found one cold-soak failure: the flyback dc-dc converter in a cheap geiger counter - it crumped below 0C (32F). And I think the PocketTracker is also a tad sensitive based on when it's gone QRT in flight - but I've never cold-soaked one.

4066. Canon A570IS for $131 & N0KKZ Intervalometer mod

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-08 04:28:55 UTC
From: Mike Manes
Topic: 4066 Message: 4066

Hi,

The Canon A570IS that Rick installed the intervalometer CDHK software
on can be had for $131 on the web:

http://www.everyprice.com/item.asp?item_id=161824&partner=g123&keyword=canon_a570_digital_
camera&gclid=CMvOrPDU_JECFSbHIgodSnfE3w&ZipCode=80128&submit=Calculate

What a huge URL! You might have to piece it together.

See Rick's code and dox along with a neat video at:
http://www.eoss.org/hardware/canon_a570is.htm
Single-button payload prep!

4069. Pre-Launch Notice for Spirit of Knoxville IV Balloon

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-09 20:01:52 UTC
From: Daniel Bowen
Topic: 4069 Message: 4069

Hello,
Spirit of Knoxville IV (SNOX IV) launch date has been set. This flight is designed to stay aloft for more than 24 hours, inserted into the current jet stream at normal flight altitudes of 30,000 to 40,000 ft. This will take the balloon into Europe over the UK and France if all goes well around 40 hours into the flight.

Launch Time: 0300 UTC March 11 (10 PM EDT March 10)
Track the mission live at: http://www.spiritofknoxville.com (the Live status page will only become active at launch)
Keep an eye on the latest progress from the launch team on the front page of spiritofknoxville.com or by using twitter to follow twitter user "spiritofknox".

Radio listeners: Flight radio details will be available on the DTRC status page which opens when you run the current version of DTRC. Download DTRC from http://dtrc.utarc.org

Thanks,
Spirit of Knoxville Crew

4075. Re: [Ballooning] ATV transmitter for balloon.

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-10 22:57:40 UTC
From: Mike Manes
Topic: 4075 Message: 4075

Hi Bruce,

EOSS also flies the PC-Electronics KPA-5 1W 70cm AM xmtr. But it
pulls 6W of dc power, so payload weight is dominated by batteries
and dc-dc converter.

We're looking at going to 1.2 GHz WBFM using a high efficiency
modulated 3W power oscillator. A CU researcher was able to get
85% dc-to-RF power at 2.45 GHz using an LDMOS single-ended oscillator.
WBFM yields a better SNR for a given received signal power so long
as the IF is in limiting, provided proper pre-emphasis is applied.
This is why the old analog direct broadcast satellite TV used that mode.
Just haven't found the required Round Tuit to get back on that project.

Provided that bit works OK, an Alford Slot antenna appears to offer
an omni pattern with gain and horizontal polarization as well as
mechanical robustness and light weight suitable for balloon flight.

If one can find an old analog sat TV set-top box, one has a downconverter
with demod and both line and Ch3 RF outputs.

4076. FAA regulations on moored balloons

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-11 01:19:39 UTC
From: Mike Manes
Topic: 4076 Message: 4076
Attachments: 1 described; binary payloads are missing from this source WARC

Hi,

14 CFR 101, Subpart B covers FAA regulations on moored balloons and basically prohibits them above 500 feet above the surface. Even so, notice to the FAA is required, as is lighting of the balloon and tethers at night.

I've attached a copy as a Word .doc file, FYI.

You may be able to get a waiver for this event, however, by filing FAA Form 7711-2 with your local FAA Airways and Procedures Office at least 45 days prior to the planned deployment. They may require that you carry an ATC Mode C transponder on the balloon as well.

Best regards,
Mike Manes

UTARC UX-20-something is over the Atlantic, telemetry received is putting distance (Great Circle) at 1176.50 mi, which is currently #3 on Ralph's record page.

If the balloon remains in it's current state (and all indications are it will), the distance record will be met before noon ET later today.

4080. Snox IV Status Update

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-11 16:20:26 UTC
From: Mike Coffey
Topic: 4080 Message: 4080

Hello all,

UTARC is excited to announce that Snox IV has comfortably broken the earlier great circle distance record of 1411 miles, set by Bill Brown in 2005. At 16:01 UTC (12:01 EDT), the balloon had traveled 1511 miles due east of the launch site, and was continuing to track in that direction at well over 100 MPH. The DTRC network is continuing to send back reports, and 142 stations have sent data. The experimental dashboard that we are using for this flight has been performing fairly well, considering the load on our servers: more than 3 million file accesses in the last 12 hours! Ballast is being used at a higher rate than expected, but we still have 3/4 of our tank left. Feel free to drop by our site at spiritofknoxville.com for more details.

73,
Mike
KJ4Z
Snox Balloon Team

4081. SNOX IV still airborne

Topic: 4081 Message: 4081

Altitude has dropped to about 20,000 ft but still going. Latest position is roughly 500 mi WSW of Ireland and from the satellite imagery it is probably flying in some cloud. Current track looks to be near the western tip of England by around 02Z tonight and near Paris about 06Z, then southeasterly towards the Adriatic by 12Z.

Even if the altitude drops tonight, the winds are roughly the same direction but lighter, still resulting in landfall in northwestern France in the early morning hours Europe time (if the English coast is missed).

It will be interesting to see if enough altitude can be maintained after the sun sets there in 2-3 hours, though if it is already in cloud it's probably not getting a lot of sun now anyway.

Stratofox recovery story of latest Stanford University flights. http://www.stratofox.org/
--W0RPK

Date: Sat, 8 Mar 2008 20:59:16 -0800
From: Ian Kluft <ikluft@...>
To: Stratofox Tracking Team <[...]>
Cc: Stratofox Amateur Aerospace Talk list <talk@...>
Subject: Re: [Trackers] B08A & B recovered!

On Sat, Mar 08, 2008 at 01:44:13PM -0800, Craig Anderson wrote:
> Just got a text message from Ian that both balloons
> were launched and both were recovered near Merced.
> The groups are having lunch in Merced now.

Thanks for forwarding that Craig.

It was a good day today! Let's see if I can make a start at a summary
and crediting people who helped. It is my intent to include everyone
so any omissions are unintentional.

We had excellent attendance. Stratofox Teams 1, 3 & 6 started from the
launch site at Galt (south of Sacramento). Stratofox Teams 2, 4 & 5
started from a rendezvous point near the projected landing zone at the
Madera Airport (north of Fresno). All the Stanford teams started at
the launch site.

B08A reached ~107,000' and landed in a field just outside the perimeter
fence of Merced College (about 3 miles SW of the recently-built UC Merced.)
If it had landed any further west it would have been in town. Ironically,
the Stratofox teams coming from the south (and one from the north) recovered
the package that landed to the north. But the reason is because that was
the one already on the ground at the time those teams got to Merced.

B08A carried the NASA BioLaunch research payload and a string of "PearlSat"
K12 school experiments. The K12 experiments were from a school in Louisiana,
who were reportedly watching the flights and searches via APRS tracking over
the Internet.

B08B reached ~68,000' (as high as intended for that payload.) It landed
south of Merced near Hwy 99 and conveniently near an exit. (Unlike last
December when B07E landed near I-5 but 10 miles from any exit). With B08A
already well-covered, the remaining teams coming from the north bypassed
Merced and went direct to B08B. Dr Cutler and his crew were first to reach
it. Almost everyone, including the crews who had just recovered B08A, got
a look before it was picked up.

B08B carried a Stanford satellite electronics & captive-carry solar sail for testing, and cameras.

Then we rendezvoused at the Merced Airport where we suggested Stratofox Air should land so we could pick them up. From there we all went to lunch.

I'll thank the Stanford crews as a group - they probably won't publicize their roster. The Stratofox participants today were...
Stratofox 1 Dave Brock N6DCB from Sacramento
Stratofox 2 Ian Kluft KO6YQ and Heather Stern KG6ZYC from San Jose
Stratofox 3 Bernhard Hailer AE6YN and Brad Douglas KB8UYR from Fremont
Stratofox 4 Christina Mester AF6BW and Andy Selle KI6JQU from Stanford
Stratofox 5 Bob Verish from Los Angeles (San Fernando Valley)
Stratofox 6 Lowell Gordy AF6BI from San Jose
Stratofox Air Dave Goodin KI6KGP, Joel Goodin and Jack ??? from San Jose

(Sorry, I didn't catch Jack's last name. He's a Stanford student who arranged to come along with Dave in the plane. Dave said he was very helpful. He also mentioned that he's studying for his Amateur Radio license. So don't be surprised if we see him becoming a Stratofox invitee and then member at upcoming events.)

As I made the list above, I noticed most of the members participating today earned their memberships last year...
* Dave Brock and Brad Douglas qualified at Crater Assault 1 at Black Rock in January 2007
* Christina Mester, Andy Selle and Lowell Gordy qualified at Biolaunch B07C in Central California in June 2007
* Bernhard Hailer and Bob Verish qualified at Stratofox's assistance to the Fossett search in Western Nevada and Eastern California in September 2007

Heather rode with Bob during the search as his radio operator.

Stanford plans more BioLaunch flights. Some experiments such as a rover and UAV glider will need to be flown away from populated areas. Those are tentatively planned to fly at Black Rock in early Summer. For folks on the talk and invitees lists, I'll mention that anyone who's interested in participating should let us know. We have a separate mail list for planning BioLaunch events, which you'll only be included on if you are or become at least an invitee, and express interest in helping with BioLaunch.

4084. Dayton Hamvention High Altitude Balloon Forum

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-13 20:31:05 UTC
From: wb8elk@aol.com
Topic: 4084 Message: 4084

Just to recap...there will be a dedicated High Altitude Balloon Forum at the Dayton Hamvention on Friday May 16th at 1:15 pm....it will be 1 hour long.

I'd like to see a final show of hands of who can give about a 10 to 15 minute presentation about their group (Callsign, Group name) so I can send in the final program schedule to the Hamvention committee....looking for those who can do a slide/video PowerPoint style presentation at the forum about their group's activities.

So far I have UTARC, HALO Network (Jeff Dailey) and Arbonet confirmed.

We also may have some brief stand-up introductions from a few others about their group....Vienna Wireless Society for example.

Also there may be an actual balloon launch from the flea market after the forum by some members of the DARA group.

I am wondering if there might be interest in a High Atitude Balloon Forum for the Dakota Division Convention and Rochester Amateur Radio Expo this August? If there is interest, please contact me so I can work on a room etc. This mini Dayton event is shaping up to be a blast aqnd I do hope you consider coming!!

On a side note, I am hoping to set up a small Cansat demo on the grounds. But, there is no active group here in Rochester to help me. Does anyone have a used Cansat I could use aand/or display?

4088. Spirit of Knoxville IV balloon mission complete

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-14 16:49:27 UTC
From: gregwilliams@knology.net
Topic: 4088 Message: 4088

The Spirit of Knoxville has declared that the SNOX IV amateur radio high-altitude balloon flight is now complete after shattering two world records and landing just shy of the European Continent in its attempt to be the first amateur payload to successfully cross the Atlantic Ocean.

Launched at 10:40 PM Eastern Time on Monday, March 10 (0240Z on 3/11) from Downtown Island Home Airport in Knoxville, Tennessee, SNOX IV traveled over 3360 miles (5310 km) and logged 40+ hours of continuous flight before dropping into the Atlantic Ocean around 1700Z on Wednesday.

The flight ended just after sunset local time as the payload approached Europe. It's last reported position placed it about 350 miles (563 km) southwest off the coast of Ireland.

Although the payload landed just shy of the UK, the mission is far from being considered unsuccessful. Utilizing a 900 cubic foot "Zero-Pressure" balloon designed by Mark Caviezel, NG0X, and a liquid ballast system designed by Carl Lyster, WA4ADG, the balloon was able to take maximum advantage of the jet stream's 100+ mph (160 kph) winds during the first 24 hours aloft. These two designs combined to keep the payload aloft for such a long duration as the temperatures at times dipped to as low as -50F (-45C).

The preliminary data is still being reviewed, but based on the information sent in from listeners and participants around the world, SNOX IV has set new records in both flight duration and distance traveled for Amateur Radio High-Altitude Ballooning, or ARHAB.

Basedon the ARHAB records maintained by Ralph Wallio, W0RPK, SNOX IV shattered the 2-year old record of 1411.41 miles (2271.44km) set by Bill Brown, WB8ELK by more than double the distance. SNOX IV also bested the recent record of 32.26 hours set by Robert Rochte, KC8UCH on August 11, 2007 by about 8 hours.

Listeners from both sides of the pond and from around the world participated by tuning in to the CW beacon and RTTY telemetry on 30 meters. By downloading software provided by the Spirit of Knoxville team, known as the Distributed Tracking and Relay Client, or DTRC, hams and shortwave listeners were able to send their reports back to the SNOX team via the internet, which in turn updated the Spirit of Knoxville web site with real-time tracking of the balloon based on accumulated reports.

At several points in the first 24 hours, demand on the SNOX IV live status page was so high that the page had to be re-worked to a text-based version in order to support the demand.

Even though the balloon set records and nearly made it across, the Spirit of Knoxville team is not going to stop trying to complete the mission they set out to accomplish along with other ARHAB groups in North America. Planning is already underway to get SNOX V off the ground to finish what SNOX IV started.

Everyone is invited to attend a live press conference via the web and the SNOX team will field questions from participants. The chat conference is scheduled for 9AM Eastern Time (1300Z) on Saturday, March 22nd. Please visit http://www.spiritofknoxville.com for more

information.

Thanks, Dan

That certainly explains the 2nd night's final descent - what a bummer!
I will say that you guys really hit the ticket by tracking in the jet
stream! But as Ian Kluft observed, hanging a left in the jet stream
is indicative of a low pressure area which can anchor a front. So
perhaps some icing did occur on the first night, forcing a major dump
of ballast.

During the ReMax helium balloon race a few years ago, the pilot that
we were crewing for characterized ballast as the equivalent of fuel
for a powered aircraft: when ya run out, the flight's over.

In Navy Aeroplane Driving School, we were taught to climb above the
tropopause in event of enroute icing. That might be useful tactic for
your next attempt. Not that this one was a failure - you sure did
prove that a crossing is feasible and that you can get near total
tracking coverage. Kudos!

From my experience running traffic for Navy MARS, it seems that AMTOR
FEC would yield fewer data errors with a weak sig than Baudot. And from
a few trials, MT63 is even more robust, although it does require a linear
PA, since it's not a constant-amplitude waveform. PSK31 might also be
a worthy candidate - ANSR had pretty good luck with that mode, and using
the FEC mode might yield even better results. It might even be worth
considering a QSY to 80m over night when the MUF drops below 5 MHz.

I look forward to reading the mail on your next attempt, hopefully this
winter before the turnaround. GL on that one!

Hi again, Dan

You can log another first: The ARRL Letter of 13 Mar 08 recorded, for the first time that I can recall, an ARHAB flight:
---clip---
* "Spirit of Knoxville" Sees Successful Launch: The trans-Atlantic balloon flight of the "Spirit of Knoxville IV" <http://www.spiritofknoxville.com/> launched into orbit on March 11 at 0200 UTC (10 PM EDT March 10). The balloon, designed to stay aloft for more than 24 hours, was successfully inserted into the current jet stream at normal flight altitudes of 30,000-40,000 feet. On Wednesday, March 12, it had made two-thirds of its journey and crossed the tectonic plate to Europe. Organizers hoped the balloon would make to Europe, but after 40 hours and 3300 miles, the balloon lost altitude late Wednesday and went into the ocean as it neared Ireland. Using radio frequencies, the balloon transmitted data detailing its current location, distance traveled, speed, height and health of the balloon. The balloon's payload consisted of hand-made computers and radios, along with a GPS and self-authored software. The onboard computer gathered such information from the GPS as altitude, speed and temperature; the computer then determined whether the balloon needed to drop weight to maintain its altitude and sent this information, via Amateur Radio frequencies, to volunteers around the globe.
---clip---

4093. SNOX article for This Week in Amateur Radio

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-15 06:42:54 UTC
From: Greg Williams
Topic: 4093 Message: 4093

http://twiar.org/audio/SNOXIV-TWIAR779.mp3

Very good audio.

I "interview" Dan and Mike for the audio clips but fortunately I'm not on the interview itself.

The entire show will be made available tomorrow or Sunday at twiar.org.

From: Joe
Topic: 4095 Message: 4095

Good Morning Ladies and Gentlemen,

Our group has a question if we may.

You have all heard the question about a helium filled balloon attached to a string (positively buoyant) while inside a stopped and completely enclosed car. When the car accelerates in the forward direction, the balloon moves forward as a function mass and density. We also know that a balloon with negative buoyancy will move backward in the same situation. Our question is this:

In which direction will a neutrally buoyant balloon move when the car accelerates?

Hmmmmm?

Joe @ NSS

Hi Joe,

Simple Newtonian mechanics applies: since the balloon has positive mass,
even though it's the same as the mass of the air it displaces, it will
move towards the rear of the car, as will the mass of air in the car.

Now, it's a close call as to whether a balloon with positive lift will
move forward, driven by the pressure gradient due to air packing to
the rear, or whether inertia will prevail. I suspect the latter. And
it all depends on whether the car's air vents are open or not.

So better take a deep breath before putting the pedal to the metal :=}.

First time I've ever heard anything like it.

> When the car accelerates in the forward direction,
> the balloon moves forward as a function mass and density.

Forward with respect to what? The ground? The car?

> We also know that a balloon with negative buoyancy will move
> backward in the same situation.

Really? How do you know that? Same questions also as above:
backward with respect to what reference frame?

This as it stands is a very ambiguously defined
situation on many levels. I can't imagine beginning to
discuss it intelligently without better specification of
the initial conditions for each of the the three balloon
types.

Are these neutral and negatively buoyant balloons in contact
with some interior surface of the car?

Topic: 4095 Message: 4098

Taking another stab at this, assuminng all three balloons
are in midair when this acceleration begins, it shouldn't
matter what their buoyancies are.

These mass and acceleration illustrations usually try to
minimize the secondary effects of things like air resistance,
so this scenario is kind of strange in that those effects, and
others such as the motion of the trapped air in the car that
Mike alluded to, could come into play.

There doesn't seem to be any kind of insight into any basic
principle exemplified and demonstrated here that I'm seeing
that wouldn't be more clearly evident with non balloon bodies
where air resistance would be dwarfed by mass.

Hank

Ok More details,

The ballon is Positive boyuant, and tied to a string which is tied to
something say on the floor of the car so that the floating balloon is
centered in the cabin of the car.

Keep reading below for more..

Ok a balloon that is filled with air that is hanging from a string from
the cieling of the car so it is again centralized in the cabin of the car.

>backward with respect to what reference frame?
>
>

The inside of the car again.

>This as it stands is a very ambiguously defined

Just the string for the negatige and positive, to be able to keep them
in place, the neutral is just floating on it's own in the center.

The balloon tips forward. I've observed this many times. Air slams into the back of the car when you accelerate. As a result, air density is lower in the front of the car where the balloon tries to float.

Paul

I've done it before, too, and have observed the same effects.

Aeronauts,

Today and for a couple of weeks I'll be polling you to help plan GPSL 2008 in hopes of making it a great experience. On the web page superlaunch.org is a section for polls, I would ask that each of you take just a minute or two and answer the poll(s), and check the results if you wish.
There may only be one today, but more will almost certainly be coming.

Thanks....
Kansas City or Burst!

Hi Hank,

I generally agree with your opinion on this topic.

But there may be some merit if one considers a theoretical (and
extreme) condition where the inertia of the enclosed air mass
forces it to evacuate from the front of the car and pack to the
rear, thus creating a horizontal density gradient not unlike the
vertical gradient produced by Earth's gravity. This condition
would not affect a neutrally-bouyant balloon, just as it's unaffected
by the normal vertical gradient. But if one assumes a positively
bouyant, and >nearly massless<, balloon, then yeah, it could move
towards the lower-density air at the front of the car - in theory.

Weird science, eh?

Thanks, Paul, for the empirical observation of a theoretical mechanism.
Some cars (not mine) can make 1G+ acceleration producing a 45 degree
angle of density gradient.

And I don't have a car big enough to fly a filled balloon, either.

Greetings everyone,
Paul has it right for the most part, or at least the parts of positive and negative, a fun video that actually shows this happening can be watched at,

http://youtube.com/watch?v=P5KuRZcq2mU

I dropped this guy a e mail asking about the neutral question, but no answer as of yet.

I'm thinking, if its neutral, is volume /density matched it's volume/ density / displacement.

I'm thinking it would move backwards upon acceleration, due to the density shift, But then I began to think,,, is there enough power to actually make it move this way

OR,, how about this,

neutral buoyancy,,

acceleration,,

air density in cabin changes,

balloon couldn't move fast enough to stay in same density field, so now resides in less dense air so it sinks., o stopping the reverse happens, the balloon rises.

hmmmmm?

We have light and dark shirts available now at Zazzle. On the front
you can customize the shirt by adding you name under the ARHAB logo.
We have this year's logo and slogan on the back.

Near Space Ventures have chosen to wear light blue as our team color.
We'd like to invite the other teams and individuals to choose any
other color.

Zazzle accepts payment by Visa, Mastercard, and American Express.

Please visit zazzle.com/kd0cfe* to view and purchase your GPSL 2008 shirt!

Hi Paul,

Thanks for starting that Wikipedia entry. Note that similar material
also appears there under "scientific ballooning", IIRC.

Some ARHAB payloads aren't digital, e.g. ATV, DF beacons, voice repeaters.
And not all use styrofoam boxes for enclosures. E.g., foamcore for
most of EOSS's and simple bubble wrap for WB8ELK's recent beacons. Some
even use fiberglass rocket tubes.

And although the US ARHAB group has acknowledged Bill Brown's pioneering
work and continuing advancements of the art, in fairness, I think
the Finnish group deserves at least honorable mention for their
flights dating back to the 60's.

It may be worthwhile to note that ARHAB has been used advantageously
by schools and scientific organizations as low-cost alternative to
sounding rockets and orbital flight, with the further advantage of
recovery of payloads and experiments (largely) intact.

4118. Cryogenic Test Chamber article

Yahoo group: GPSL (2002 — 2008)
Date: 2008-03-25 05:40:00 UTC
From: Dan Bowen
Topic: 4118 Message: 4118

Hi All,
I just came across a nice tutorial for a cryogenic test chamber. These have been invaluable in our long duration flight testing, and I wish we had thought to make one a long time ago, even for short flight electronics testing. You can sometimes rely on latent heat for latex flights, but longer than a few hours and you either have to survive cold or turn on the heater. We have made a chamber with a large styrofoam cooler (2" walls) using a DS1820 temp sensor to thermostatically control a 5" PC fan. The cooler we had was actually a dry-ice medical shipping container, obtained (for free) by request from a local pharmacy. Using 15lbs of dry ice allows -50C for over 48 hours undisturbed. At most grocery stores that carry it, dry ice goes for $1.00/lb. I think electronics testing firms recommend no more than 4 degrees C per minute (down or up) to ensure even contraction or expansion of all electrical components.

Hi Dan,

Dry ice sublimates at about -100C, and we've been able to get -80C
in our homebrew 2" thick building foam chamber. The chamber has
two "floors": the "basement" is for the payloads and the upper one
is for the dry ice. A 4" muffin fan mounted between the floors at one
end and an exhaust vent at the other gets the job done. Since we've
not planned any long-duration flights, it's been a long time since
we've used the "coffin". A common food freezer cold soaks the DUT
to -18C (0F), which is lower than any internal temp that we've
measured.

Hi Paul,

Neat design! Have you ever integrated a vacuum chamber with this
to also simulate altitude? We've used both freezers and a homebrew
vacuum chamber to test stuff in the past, but never both at once. Has
anyone built something that can do a frigid, sparse atmosphere?

Hi John,

Of course, it would be possible to put dry ice in a vacuum chamber, but the sublimation temperature would drop considerably. From my Dad's 1937 Ed of Hdbk Chem Phys, the saturated vapor temp of solid CO2 at 10 mbar (100K') is about -120C, compared to -80C at 1 atm. But since the dry ice isn't that cold by the time you get it, the vacuum would most likely cause the vaporization rate to accelerate.

Since C02 combines with water vapor to form carbonic acid, one may risk corrosion damage to the vacuum pump. If the dry ice were enclosed in a pressure vessel at room ambient with good thermal conduction, that problem could be averted.

Such a system would allow one to evaluate the effectiveness of heat sinks, however, which lose effectiveness as convectors at 10 mbar and thus must rely on radiative heat transfer to the environment. Fortunately, radiative transfer varies as the 4th power of temperature difference.

So we need to build a Styrofoam box under the metal bottom of a vacuum chamber. Without a functioning fan to ciculate cold air, we're relying on thermal conduction to chill the payload.

It seems to me that vacuum systems are expensive. I wonder if something could be rigged up in a metal enclosure. We really don't need to see inside the chamber. Or if we have to, we could use a small, cheap digital camcorder and light.

Paul
